This document contains: Supplementary Figures: Fig. S1-S2

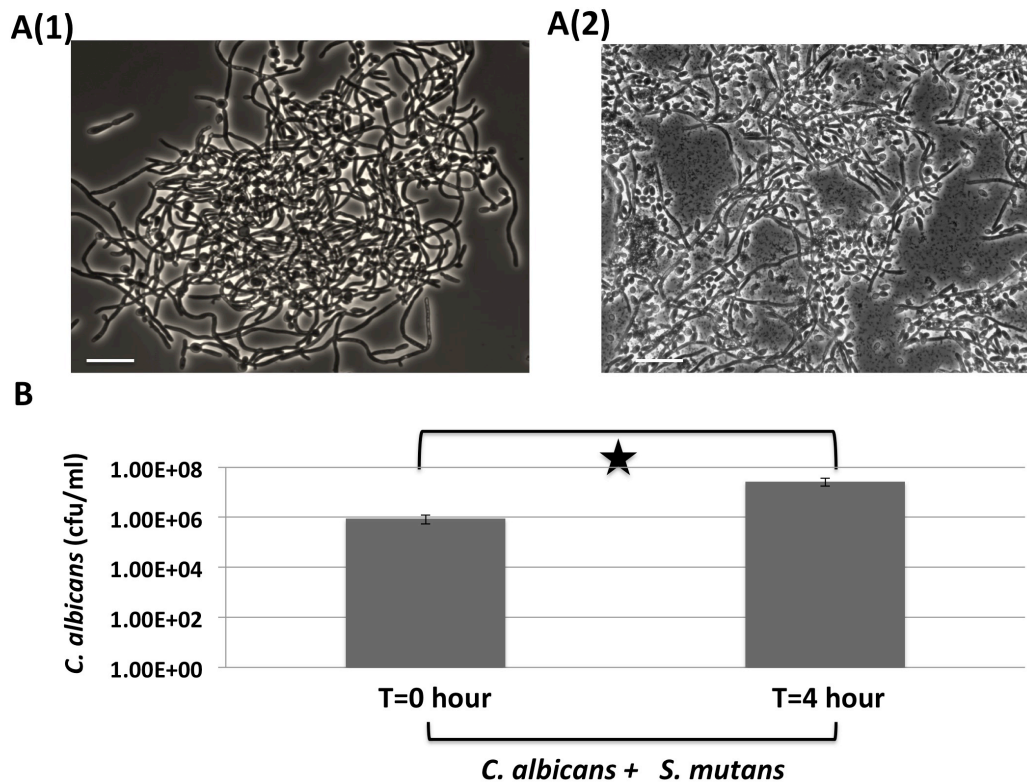

Fig. S-1. **Co-cultivation of *C. albicans* with *S. mutans*.** *C. albicans* was cultured with *S. mutans* in YPD medium supplemented with 20% FBS at 37°C under aerobic conditions for 4 hrs. (A) Samples were taken 4 hours after cultivation and visualized under the microscope. At least 10 images were taken for each sample and only representative images are shown. (B) *C. albicans* viability was monitored as described in Materials and Methods before and after co-cultivation. A star indicates P<0.05. The scale bar is 10 μ m.

Fig. S-2: **Viability of *F. nucleatum***. RAW macrophage cells were challenged with co-culture of *F. nucleatum* and *C. albicans* as described in Materials and Methods. Viability of *F. nucleatum* was monitored before and 90-minutes after incubation.
