

The goal of this study is to detect a possible preventive role of facebook against depression. For this, we provided you this booklet that is composed to 3 questionnaires:

- ✓ PHQ-9 scale that measures the **tendency** to develop depression, **if any**;
- ✓ FBAQ scale which measures the facebook activity.
- ✓ SDQ scale

Note that each participant is **anonymous** and not any clue, from the booklet, will tell about the identity.

Hence feel free to fill these 3 scales; it won't take you much time but it may mean a lot on larger scientific scales. It is your right whether to participate or not and your refusal will not harm you in anyway. Your participation will add value on top of the scientific meaning. You can terminate at any point.

Kindly mark a signal if you agree to take it.

<input type="radio"/>	<input type="checkbox"/> <i>I Agree</i>
<input type="radio"/>	<input type="checkbox"/> <i>I Disagree</i>

In case you disagree, please inform us about the reason(s).
