

**A targeted analysis reveals relevant shifts in the methylation and transcription of genes  
responsible for bile acid homeostasis and drug metabolism in non-alcoholic fatty liver disease**

Supplement

Shown are genes that showed NAFLD dependent methylation transcription associations as listed in table 5 and 6 (alphabetical order). The expression of up to five upstream and 5 downstream located genes (if available and measured by the affymetrix array) was linearly regressed to the average methylation changes of the CpG sites associated to the key genes listed in column 2.

\* The number allocates a running number to the key gene investigated and listed in table 5 followed by a running number for the neighbouring gene investigated here with regard to associations between methylation and transcriptional expression.

\*\*Regression analyses studying the association between average methylation in the TSS1500 interval of the gene listed in column 2 and transcription of the neighbouring genes listed in column 3 in the EC cohort. Analyses are taking the strength of fibrosis into account either as independent covariate (column 6 and 7) or as interaction term that combines fibrosis and expression (column 8 and 9).

\*\*\*Pearson's correlation analyses correlating average methylation state in the TSS1500 interval and strength of transcription in NAFLD and non-NAFLD patients of the EC cohort

-, no coefficient given for non significant results; No, number; ns, not significant; coef, coefficient; ID, identification number
