#### **The PDF file includes:**

Fig. S1. Multiple alignment of different Env (120–204) and partial V2 sequences (160–183).

Fig. S2. Cocrystal structure of HIV-1 gp120 (red) binding to CD4 (green) and the Fab of mAb 17b (blue) (23).

Table S1. Odds ratios for two-way interaction analysis of HLA class II alleles with Env-specific IgA and Env (120–204)-specific IgG.

Table S2. Association between Env-specific IgA or Env (120–204)-specific IgG and HLA class II alleles present in more than 5% of the study population.

Table S3. High IgG binding to multiple Env (120–204) antigens correlates with presence of DPB1\*13 and is associated with decreased HIV-1 acquisition across multiple subtypes.

Table S4. IgG responses to five overlapping peptides spanning Env (120–204) were significantly associated with presence of DPB1\*13.

Table S5. Comparison of frequency of amino acid (AA) sites in Env-gp70 in RV144 breakthrough infections stratified by DPB1\*13.

Table S6. Odds ratios for IgA binding to different recombinant Env proteins on HIV-1 acquisition after stratification by absence or presence of HLA-DQB1\*06.

Table S7. Odds ratios for HIV-1 acquisition in univariate analyses of all HLA class II alleles present in the placebo controls.

Table S8. Odds ratios for HIV-1 acquisition in univariate analyses of all HLA class II alleles present in the vaccinated volunteers.

**Fig. S1. Multiple alignment of different Env (120–204) and partial V2 sequences (160–183).** HIV-1

Env amino acid sequences corresponding to either positions 120–204 or 160–183, relative to the HXB2 sequence reference from different viral subtypes (see table S3) were aligned using Clustal Omega. Sequences matching DPB1\*13 specific epitope 120-133 are shown in bold.

**Fig. S2. Cocrystal structure of HIV-1 gp120 (red) binding to CD4 (green) and the Fab of mAb 17b (blue)** (23). The IgG response identified, which was found to associate with both presence of DPB1\*13 and also reduced risk of HIV-1 acquisition, was directed to the Env residues with atoms highlighted in red spheres (residues 124P, 125L, 126C, 127V). IgG binding to this region of Env would be expected to disrupt interaction with CD4. Also highlighted in red is Env residue 121K, binding site of the well-characterized neutralizing mAb 17b.

**Table S1. Odds ratios for two-way interaction analysis of HLA class II alleles with Env-specific IgA and Env (120–204)-specific IgG.**
