

SUPPLEMENTAL INFORMATION

The *Listeria monocytogenes* Fur-regulated virulence protein FrvA is an Fe(II) efflux P_{1B4}-type ATPase

Hualiang Pi¹, Sarju J. Patel², José M. Argüello² and John D. Helmann^{1*}

SUPPLEMENTAL FIGURES

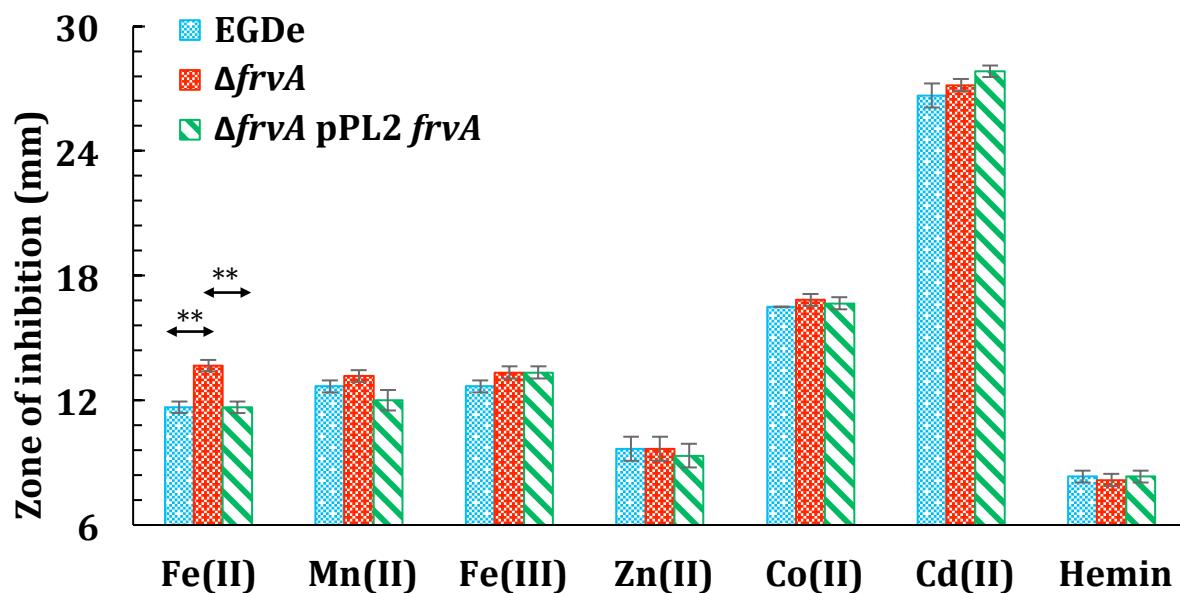

Fig S1. An *frvA* mutant is sensitive to iron intoxication in *Listeria monocytogenes*.

Sensitivity of wild-type EGDe, an isogenic *frvA* null mutant ($\Delta frvA$), and an *frvA* complemented strain ($\Delta frvA$ pPL2 $frvA$) to different metal ion stress as measured by a disk diffusion assay. 10 μ l of 1 M metal ion as indicated or 10 mM hemin was added onto the paper disk. The results are expressed as the diameter (mean \pm SD; n=3) of the clearance zone (mm). **P<0.01 indicates a statistically significant difference between the indicated groups.

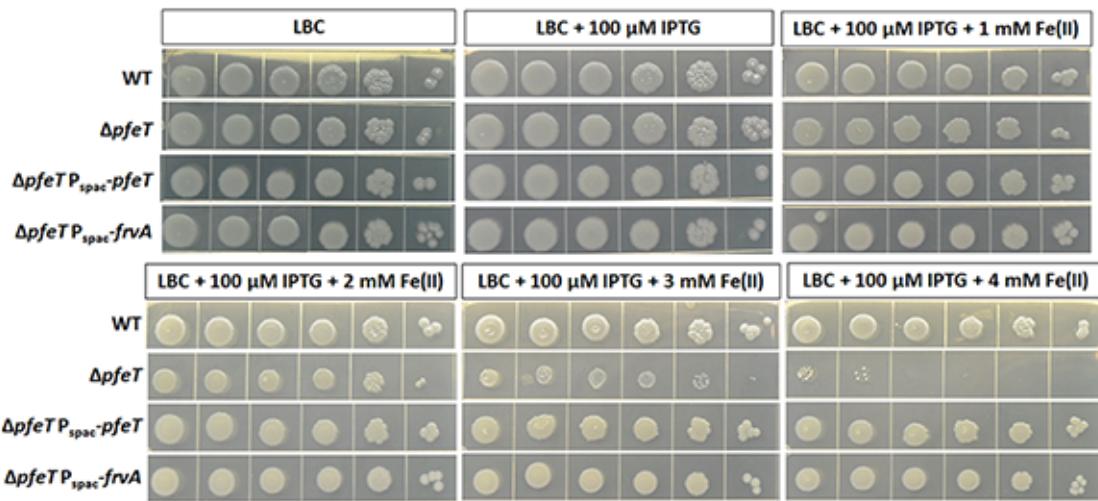

Fig S2. *L. monocytogenes frvA* complements a *B. subtilis* *pfeT* mutant.

Representative photographs of a spot dilution assay with WT (CU1065), $\Delta pfeT$, *pfeT* P_{spac} -*pfeT*, and *pfeT* P_{spac} -*frvA* on LBC agar amended with 100 μ M IPTG and various concentrations of FeSO_4 as indicated. Spots represent undiluted original cell culture on the left to 10^{-5} dilution on the right in 10-fold decrements.

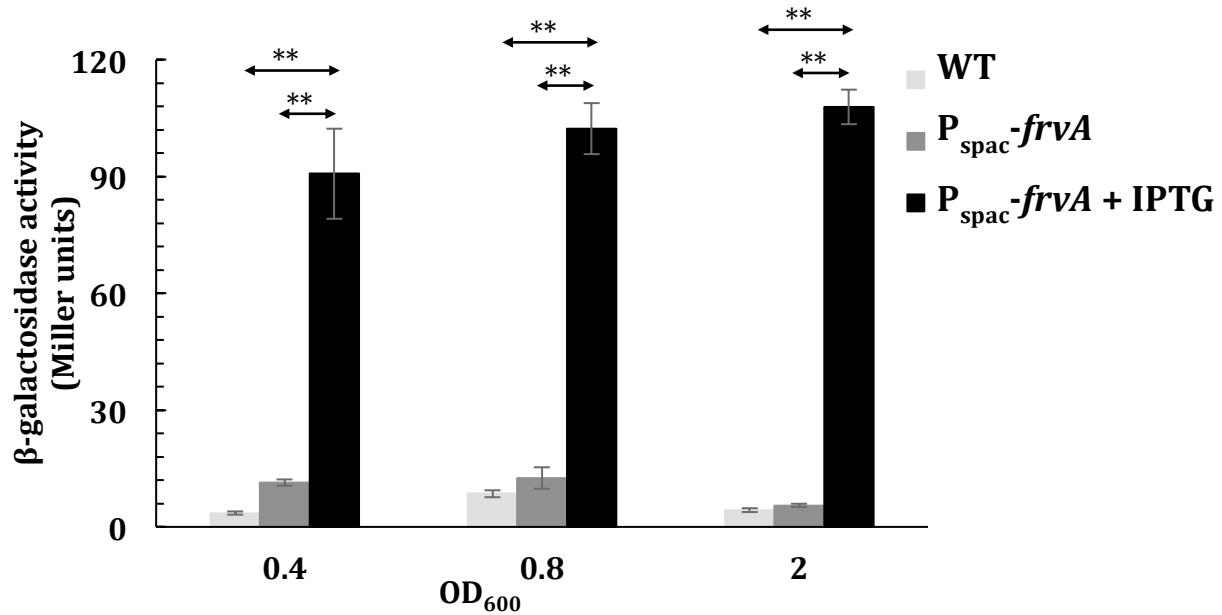

Fig S3. Induction of *dhbA* is increased in cells expressing FrvA.

WT strain CU1065 and CU1065 P_{spac}-frvA (without and with 1 mM IPTG induction) carrying a *dhbA-cat-lacZ* reporter fusion were grown to different growth points as indicated in LB medium and assayed for β -galactosidase activity. ** indicates a statistically significant difference (P<0.01) between the indicated groups.
