

636 **Figure S1.** Hematoxylin and eosin (H&E) stain (upper panel) and acid-fast stain (lower panel) of a
637 typical rabbit necrotic granuloma at 10 weeks post-infection, prior to treatment initiation, at
638 10x magnification. The inset shows a 40x magnification of the central core with intracellular
639 (black arrows) and extracellular (orange arrows) bacilli seen in the macrophage rim (M) and
640 caseating core (C), respectively. Note that the extracellular bacilli may be encased in dead cell
641 remnants. Scale bar: 200 μ m in the low resolution image and 50 μ m in the high resolution inset.
