

Figure S2. Activity of 10E8 mAb to activate ADCC reporter gene. H9/IIIIB (A) and 293T cells that express Env of different HIV-1 strains, including B02 (B), CH119 (C) and GX11.13 (D) were used as the target cells and the the engineered, immortalized T lymphocyte Jurkat cells that express the FcγRIIIa receptor as the effector cells (Promega) in the ADCC Reporter Bioassay. The samples were tested in triplicate and the data are shown in mean \pm SD.
