ABSTRACT

Figures and tables, supplementary to the main papers, are given that concern the 70 investigated genomes. Table 5 presents the essential data and the public databases where genomes were downloaded. Table 6 reports experiments in computational synthetic biology.

Table of Content

Figure 1: Taxonomy tree of the 70 genomes (Sup. Fig. 1)	2
Figure 2: A 3D-visualization of 70 genomes (axes AC, LX, BB) by means of Principal Component Analysis (Sup. Fig. 2)	3
Figure 3: The partition of LG represented by means of ellipses (Sup. Fig. 3)	3
Table 1: Horizontal Eccentricity Classes (Sup. Table 1)	4
Table 2: AC values for a kernel of 40 genomes (Sup. Table 2)	5
Table 3: Informational indexes for the 70 genomes (Sup. Table 3)	6
Table 4 Entropies and indexes for different values of k (Sup. Table 4)	7
Table 5 Basic data of the 70 genomes (Sup. Table 5)	8
Table 6 Computational experiments on synthetic genomes (Sup. Table 6)	9

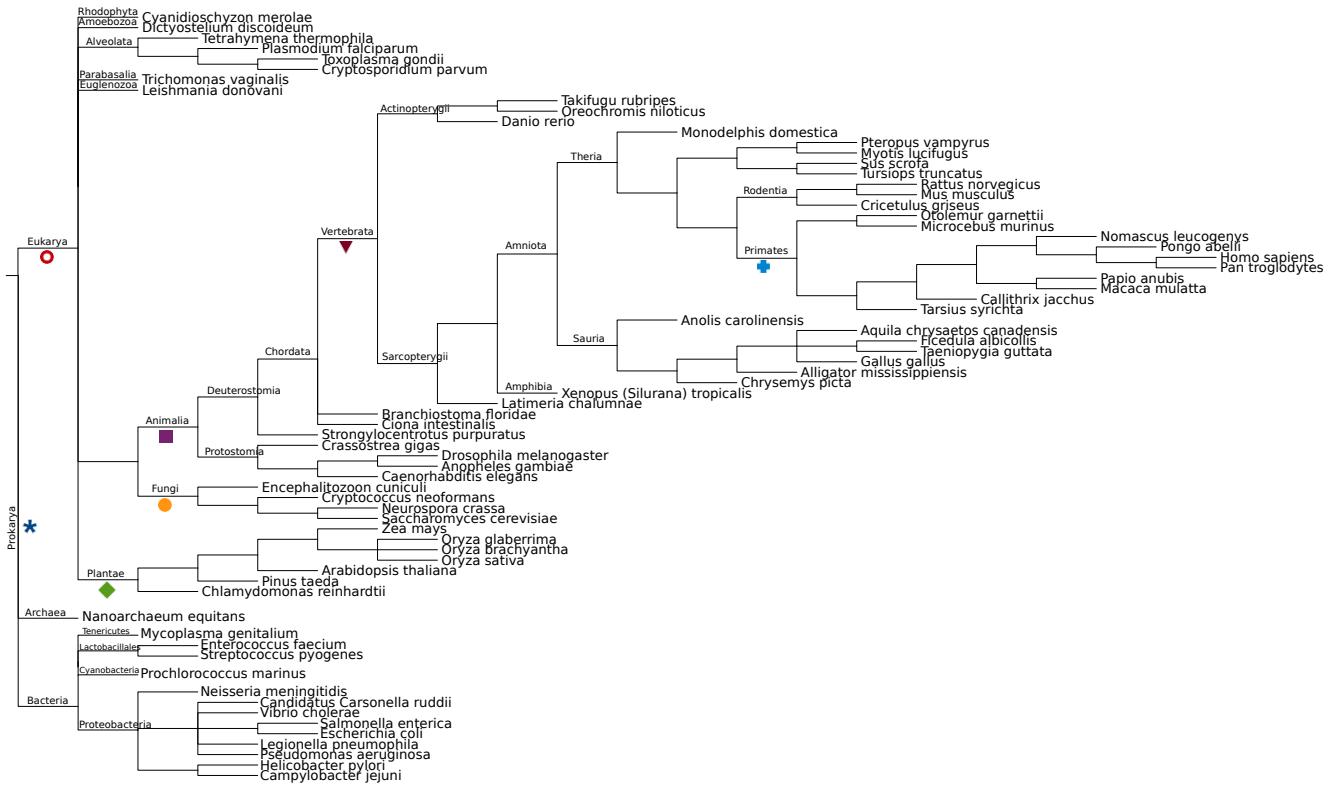

Figure 1. A taxonomy tree of the 70 analysed genomes. The tree has been built via the NCBI taxonomy (see reference 40 on the main paper) on-line service (<http://www.ncbi.nlm.nih.gov/Taxonomy/CommonTree/wwwcmt.cgi>). Branches of interest (Prokarya, Eukarya, Plantae, Fungi, Animalia, Vertebrata and Primates) are marked with their corresponding icon. Branches of the tree have fixed length, as opposed to classical phylogenetic trees where they length is based upon genetic distances.

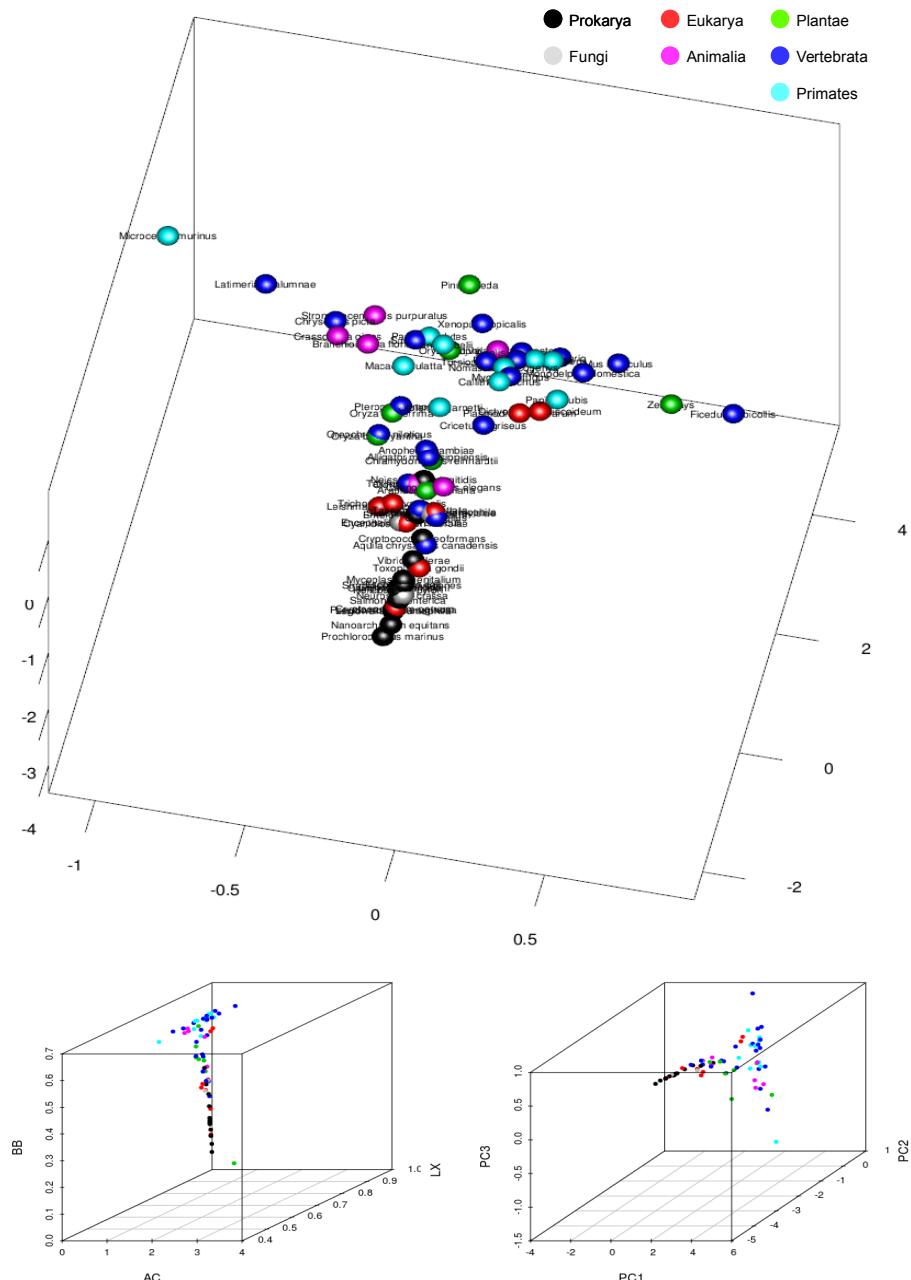

Figure 2. A 3D-visualization of 70 investigated genomes, obtained by taking into account three informational indexes AC , LX , BB . Bottom-left: the raw values of the three variables are plotted in 3D; Bottom-right: along the three axes Principal Component Analysis (PCA) of values on the left are used; Top: an enlarged version of Bottom-right is given, where a sort of tree (with exceptions) is apparent, going bottom-up (from primitive to more complex genomes).

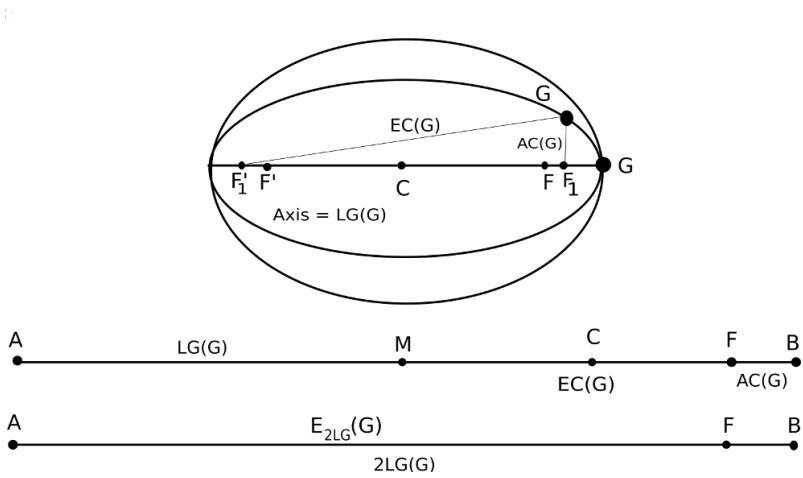

Figure 3. The partition of genome logarithmic length and the horizontal and vertical genomic ellipses. Segment AB corresponds to $2LG$, segments AM, MB correspond to LG , segment AF corresponds to E_{2LG} , segment MF and FB correspond to EC and AC , respectively, and F determines a partition of LG . Point F correspond to a focus of the horizontal ellipse, while F_1 to a focus of the vertical ellipse, and C is the center of ellipses. The less eccentric ellipse is the *horizontal genomic ellipse*, where \mathbb{G} is on the major axis, while the more eccentric one is the *vertical genomic ellipse*, where \mathbb{G} is on the line orthogonal to the major axis and passing on its focus. The eccentricity EV of the vertical ellipse is the root square of the horizontal eccentricity EH , and the distance between the focuses F and F_1 is $EV(1 - EV)LG/2$. Infinite ellipses, with the same major axis, but with different values of eccentricity, can represent \mathbb{G} as a point placed at different angles from the axis. The genomic complexity measure $BB(\mathbb{G})$, *biobit* of \mathbb{G} , is defined by means of the horizontal eccentricity EH .

First Class

Table 2. AC values for forty different species. Length of genomes, $N\%$ (the percentage of unknown nucleotides), and number of genes (in the wider sense of transcribed regions, that is, protein and non-protein coding genes) are not related to AC values. Color red and *** mark two cases of anomalous AC values. Finding a genomic complexity measure based on AC , but overcoming the anomalies of two marked cases, was the starting point of the logarithmic length partition idea and of informational indexes based on it.

Table 5. The complete list of 70 genomes with the common names (when available), their biological taxonomy, their common name, the source database from where each has been downloaded, the corresponding genome assembly ID within the database, the genome length |G|, (genomes may include standard chromosomes, as well as mitochondrial ones, plasmids and linkage groups),and the percentage N% of unknown nucleotides.

Gene ID	Description
MG_rrnA16S	16S ribosomal rRNA
MG_289	phosphonate ABC transporter, substrate binding protein (P37), putative
MG_340	DNA-directed RNA polymerase, beta subunit
MG_497	tRNA (ARG)
MG_186	Oligosaccharide or polyol ABC transporter, substrate binding protein
MG_194	phenylalanyl-tRNA synthetase, alpha subunit
MG_312	high molecular weight cytadherence accessory protein 1
MG_069	PTS system, glucose-specific IIABC component
MG_386	P200 protein
MG_191	MgPa adhesin
MG_217	P65 adhesin
MG_192	P110 protein
MG_318	P32 adhesin
MG_159	ribosomal protein L29
MG_317	high molecular weight cytadherence accessory protein 3
MG_338	lipoprotein, putative
MG_200	DnaJ domain protein
MG_203	DNA topoisomerase IV, B subunit
MG_226	amino acid-polyamine-organocation (APC) permease
MG_506	tRNA (SER)
MG_042	spermidine/putrescine (polyamine) ABC transporter, ATP-binding protein, putative
MG_185	lipoprotein, putative
MG_309	lipoprotein, putative
MG_509	tRNA (LYS)
MG_434	uridylate kinase
MG_079	oligopeptide ABC transporter, ATP-binding protein
MG_068	lipoprotein, putative
MG_470	CobQ/CobB/MinD/ParA nucleotide binding domain
MG_219	unknown
MG_290	phosphonate ABC transporter, ATP-binding protein, putative
MG_526	salivaricin A ABC transporter, ATP-binding protein
MG_384	GTPase1 Obg
MG_111	glucose-6-phosphate isomerase
MG_100	glutamyl-tRNA(Gln) and/or aspartyl-tRNA(Asn) amidotransferase, B subunit
MG_500	tRNA (LEU)
MG_246	Ser/Thr protein phosphatase 2A
MG_118	UDP-glucose 4-epimerase
MG_047	S-adenosylmethionine synthetase
MG_463	dimethyladenosine transferase
MG_360	ImpB/MucB/SamB family protein
MG_179	metal ion (cobalt) ABC transporter, ATP-binding protein, putative
MG_008	tRNA modification GTPase TrmE
MG_184	adenine-specific DNA modification methylase
MG_387	GTP-binding protein Era

Table 6. A list of 44 genes of *Mycoplasma genitalium* genome that, when removed, provide the failure of genome informational laws. Table reports gene identifiers and their description provided in the *WholeCellKB* database (<http://www.wholecellkb.org/list/Mgenitalium/Gene>). The selection of the reported genes was done iteratively by making use of a greedy removal procedure. At each step, the gene is removed, together with its genomic context, that minimizes the AF value. Then, the procedure is applied iteratively to the reduced genome. Genes are reported in the same order they were selected. After 44 gene deletions, we obtained a sequence of length 487,137, hosting 476 genes, for which the fourth law (see Equation 8 in the paper) does not hold. Further gene removals produce sequences where other laws fail (even if the removal do not minimize AF).
