

## **Supplementary Figures**

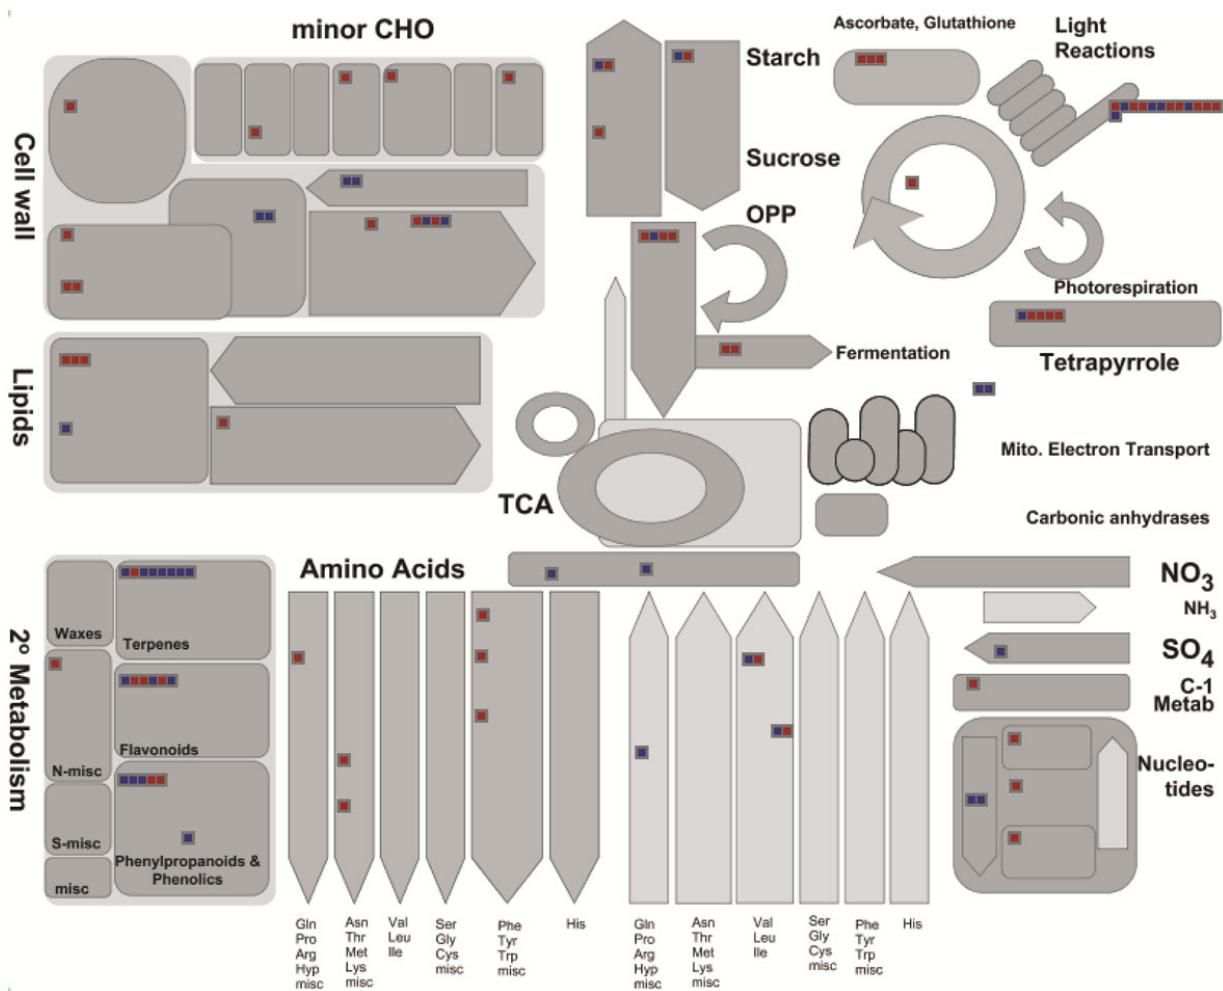

**Figure S2: Variation of historical recombination rates along the ten maize chromosomes.**

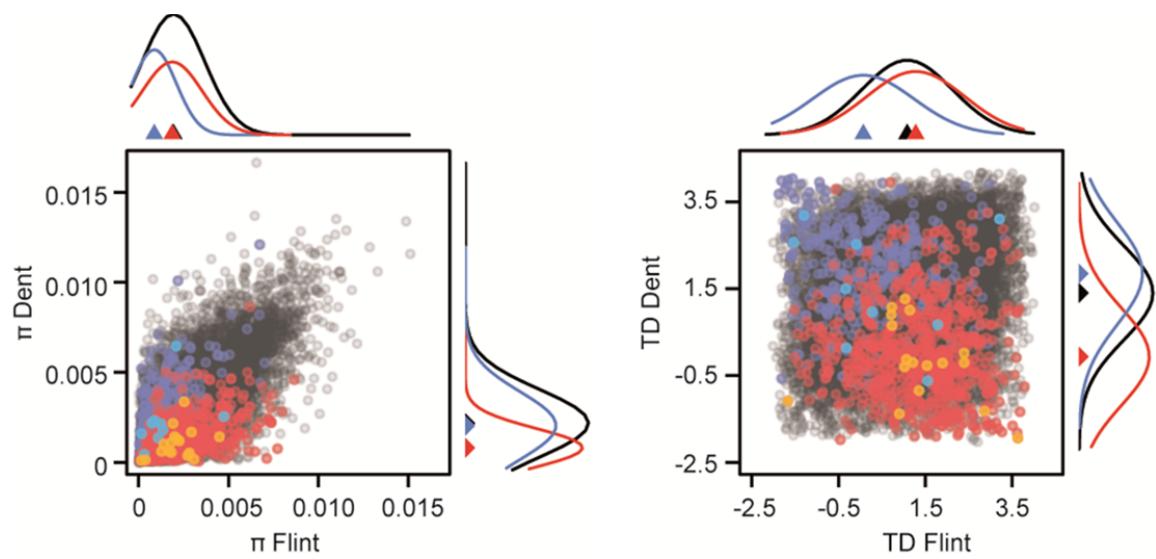

Minimal number of recombination events observed per Megabase (Mb) in 70 Dent (red) and 66 Flint lines (blue) based on genotyping data. The position of candidate genes is highlighted in the corresponding colors; dashed lines indicate the 10% quantile of recombination events per Mb for Dent (red) and Flint (blue) and grey triangles indicate the position of centromeres.

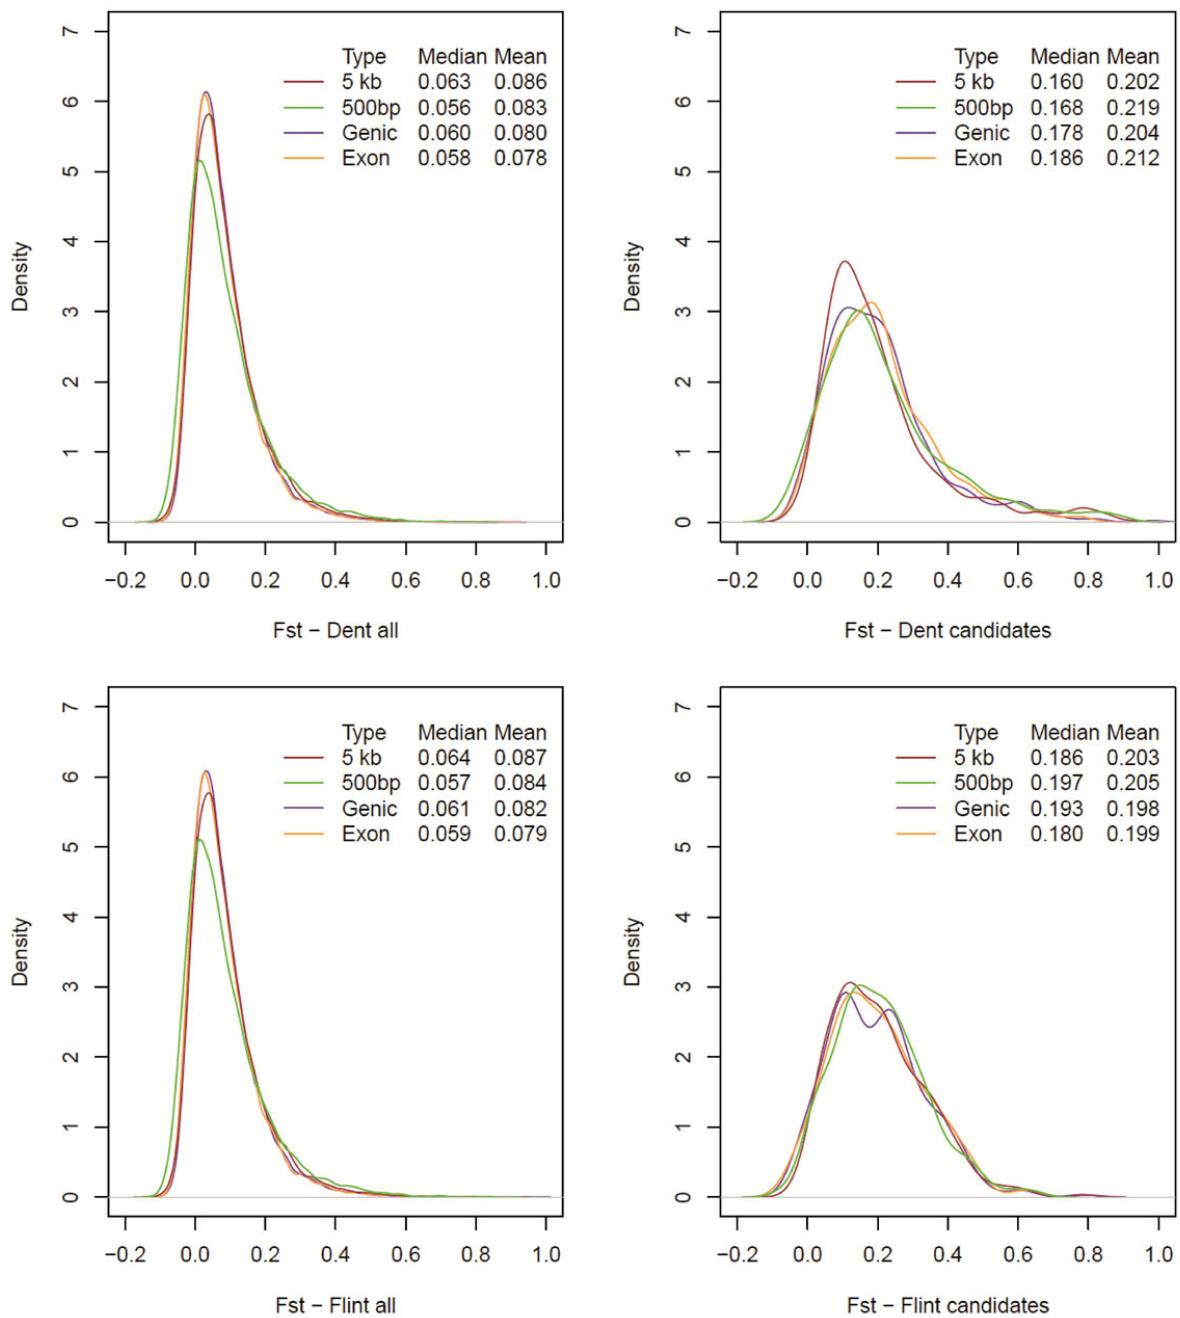

**Figure S3: Gene ontology (GO) terms assigned to categories of biological processes for the candidate gene sets.**  
GO terms were available for 333 Dent candidates (red) and 214 Flint candidate genes (blue) compared to the background ( $N = 25,288$ ; grey).

**Figure S4: Pathway analysis for the Dent and Flint candidate gene sets using MapMan [53].** Pathway assignments were available for 58 genes for Dent (red squares) and 40 candidate genes for Flint (blue squares) based on the first transcript per gene. For visualization, values of -4.5 and 4.5 were assigned to Dent and Flint candidate gene transcripts, respectively.

**Figure S5: Gene-wise  $\pi$  (left) and TD (right) values based on whole-genome sequence data of 21 temperate Dent and 19 temperate Flint lines.** Values for all genes are shown in black, selection candidates are highlighted in red (Dent) and blue (Flint). Candidates associated with the flowering network are labelled in orange (Dent) and light blue (Flint). The relative distribution of values is shown by density plots with means indicated by triangles of the corresponding colour.

**Figure S6: Distributions of  $F_{ST}$  values for different genomic regions based on whole-genome sequence data of 40 elite lines.** Distributions for 5 kb and 500 bp upstream, genic and exonic regions are shown for all genes except candidate genes on the left and for candidate genes on the right.  $F_{ST}$  values in 21 Dent lines are shown in the upper part and values in 19 Flint lines in the lower part. Details are given in **Table S4**.

**Table S2:** Window-based statistics and thresholds according to the selected quantile based on the panel of 136 temperate inbred lines genotyped with the 600 k array.

Statistic	Pool	Sample size	Min.	Median	Mean	Max.	Threshold
Nucleotide diversity $\pi$	Dent	70	0.000	0.318	0.308	0.505	0.213
	Flint	66	0.009	0.318	0.310	0.507	0.220
Tajima's $D$	Dent	70	-1.070	0.780	0.730	1.775	0.202
	Flint	66	-1.070	0.723	0.682	1.769	0.169
Composite likelihood ratio	Dent	70	0.000	0.596	4.062	474.000	6.790
	Flint	66	0.000	0.526	6.106	598.100	6.498
Fixation index $F_{ST}$	Dent vs. Flint	136	-0.014	0.125	0.144	0.804	0.261

**Table S4:** Gene-wise statistics for all genes and for Dent and Flint candidate genes. Number of genes, mean and median  $F_{ST}$  values (mean  $\pm$  standard error; se) are given. All differences between candidate genes and remaining genes were significant with  $p < 2.2\text{e-}16$  determined by two-sided Wilcoxon rank sum tests. Data set G refers to 600 k genotyping data and data set S to whole-genome sequence data.

Statistic	Data set	Pool	All genes			Candidate genes		
			Number	Mean $\pm$ se	Median	Number	Mean $\pm$ se	Median
Normalized $H$	G	Dent	16,298	-0.198 $\pm$ 0.003	-0.127	278	-0.791 $\pm$ 0.030	-0.761
