* Abbreviations: CHO, carbohydrates; SFA, saturated fatty acids; MUFA, monounsaturated fatty acids; PUFA, polyunsaturated fatty acids; IS, insulin sensitivity. Results for C-peptide were not shown, because of too few trials for stratified meta-regression (n trials=6 in total). Values represent the pooled estimated mean change (95% confidence interval) according to isocaloric exchange of two macronutrients with other macronutrient intakes held constant. The models adjusted for factors varying between within-trial arms, including intakes of protein and trans-fat (% energy) and dietary fiber (g/1000 kcal). 1 mg/dL=0.056 mmol/L for glucose; 1 µIU/mL=6 pmol/L; HbA1mmol/mol=(HbA1c % - 2.15)×10.929. See reference list in the Supplementary Information (S3 Text).

† Significant heterogeneity with $\alpha=0.05$ level corrected for false-discovery rate inflated by multiple tests for strata and substitution effects.

‡ Not fitted because of a limited number of trials, yielding failure of convergence or unrealistic estimates.
