1. Figures

eFigure 1; GPIU Study conduct summary

eFigure 2. Patient/ case disposition.

eFigure 3; Statistical model structure.

eFigure 4, Overall frequency of pathogens in consecutive study years.

(CoNS=Coagulase negative staphylococcus)

Fluctuations in the pathogen spectrum frequency can be observed. However, there is no time trend associated with these fluctuations (multiple logistic regression analysis, Likelihood-ratio p value>0.05)

eFigure-5, Annual resistance rates of antibiotics in urosepsis. Fluctuations in resistance can be seen, however on the overall 11-year time period a significant change was not identified.

3. Classification of UTIs used in the GPIU Study

3.1. Introduction

Traditionally, UTIs are classified based on clinical symptoms, laboratory data, and microbiological findings. Practically, UTIs have been divided in uncomplicated and complicated UTIs, and sepsis. It is important to underline that the following proposed classification is still not validated or recognised. It is a working instrument.

A critical review of present classifications was undertaken for the EAU/ICUD Urogenital Infections initiative (1) in Appendix 16.1. The overall aim is to provide the clinician and researcher with a standardised tool and nomenclature for UTI. The present guidelines give a short summary of a tentative improved system of classification of UTI based on:

- anatomical level of infection;
- grade of severity of infection;
- underlying risk factors;
- microbiological findings.

The symptoms, signs and laboratory finding focus on the anatomical level and the degree of severity of the infection. The risk factor analysis contributes to define any additional therapeutic measure required (i.e. drainage).

3.2. Level of infection

The symptoms, as presented in the Appendix 16.1, focus on the level of infection, defined as:

- urethritis (UR);
- cystitis (CY);
- pyelonephritis (PN);
- sepsis (US).

Urethritis being poorly understood is for the time being not included in the algorithm and treatment strategy of pure UTI. The male genital infections prostatitis and epididymitis are also not included.

Asymptomatic bacteriuria (ABU) needs to be considered a special entity because it can have its source in both the lower and upper urinary tracts, and requires no treatment unless the patient is subjected to urological surgery.

3.3. Grade of severity

The grade of severity is set on a scale of 1-6 that is related to the risk of fatal outcome (Figure 1)

Figure 1: Traditional and improved classification of UTI as proposed by the EAU European Section of Infection in Urology (ESIU) (1)

* see Figure 2

** see Table 1

Table 1: Host risk factors in UTI

Type	Category of risk factor	Examples of risk factors
O	No known/associated RF	- Healthy premenopausal women
R	RF of recurrent UTI, but no risk of severe outcome	<ul style="list-style-type: none"> - Sexual behaviour and contraceptive devices - Hormonal deficiency in post menopause - Secretory type of certain blood groups - Controlled diabetes mellitus
E	Extra-urogenital RF, with risk or more severe outcome	<ul style="list-style-type: none"> - Pregnancy - Male gender - Badly controlled diabetes mellitus - Relevant immunosuppression* - Connective tissue diseases* - Prematurity, new-born
N	Nephropathic disease, with risk of more severe outcome	<ul style="list-style-type: none"> - Relevant renal insufficiency* - Polycystic nephropathy
U	Urological RF, with risk or more severe outcome, which can be resolved during therapy	<ul style="list-style-type: none"> - Ureteral obstruction (i.e. stone, stricture) - Transient short-term urinary tract catheter - Asymptomatic Bacteriuria** - Controlled neurogenic bladder dysfunction - Urological surgery
C	Permanent urinary Catheter and non resolvable urological RF, with risk of more severe outcome	<ul style="list-style-type: none"> - Long-term urinary tract catheter treatment - Non resolvable urinary obstruction - Badly controlled neurogenic bladder

RF = Risk Factor; * = not well defined; ** = usually in combination with other RF (i.e. pregnancy, urological intervention).

3.4. Pathogens

Urine culture will usually identify the causative pathogen ($\geq 10^4$ cfu/mL) and its susceptibility pattern. Both characteristics can be introduced in the final classification of the clinical stage of infection. The degree of susceptibility is defined as grade a (susceptible) to c (resistant).

3.5. UTI Classification

Figure 2 shows a summary of the additive parameters that make up an individual class of UTI.

Figure 2: Additive parameters of UTI classification and severity assessment

By cumulating the different parameters, a UTI can be classified as follows (1):

- CY-1R: *E. coli* (a): simple cystitis but recurrent with susceptibility to standard antibiotics.
- PN-3U: *K. pneumoniae* (b): severe pyelonephritis (with high fever and vomiting), with underlying urological disease (e.g. stones or obstruction) due to *Klebsiella* sp., with a moderate antibiotic resistance profile.
- US-5C: *Enterococcus* sp (a): severe urosepsis with an antibiotic-sensitive *Enterococcus* sp. in a patient with an indwelling catheter.

4. CDC Definitions Used in the GPIU study for diagnosis of HAUTI,^{1,2}₃

Urinary Tract Infection

Urinary tract infection includes symptomatic urinary tract infection, asymptomatic bacteriuria, and other infections of the urinary tract.

Symptomatic urinary tract infection must meet one of the following criteria:

1. One of the following: fever ($>38^{\circ}\text{C}$), urgency, frequency, dysuria, or suprapubic tenderness AND a urine culture* of $\geq 10^5$ colonies/ml urine with no more than two species of organisms
2. Two of the following: fever ($>38^{\circ}\text{C}$), urgency, frequency, dysuria, or suprapubic tenderness AND any of the following:
 - i. Dipstick test positive for leukocyte esterase and/or nitrate
 - ii. Pyuria (≥ 10 white blood cells (WBC)/ml or ≥ 3 WBC/high-power field of unspun urine)
 - iii. Organisms seen on Gram stain of unspun urine
 - iv. Two urine cultures with repeated isolation of the same uropathogen⁺ with 10^2 colonies/ml urine in nonvoided specimens
 - v. Urine culture with $\leq 10^5$ colonies/ml urine of single uropathogen in patient being treated with appropriate antimicrobial therapy
 - vi. Physician's diagnosis
 - vii. Physician institutes appropriate antimicrobial therapy
3. Patient ≤ 12 months of age has one of the following: fever ($>38^{\circ}\text{C}$), hypothermia ($<37^{\circ}\text{C}$), apnea, bradycardia, dysuria, lethargy, or vomiting AND urine culture of 10^5 colonies/ml urine with no more than two species of organisms
4. Patient ≤ 12 months of age has one of the following: fever ($>38^{\circ}\text{C}$), hypothermia ($>37^{\circ}\text{C}$), apnea, bradycardia, dysuria, lethargy, or vomiting AND any of the following:
 - i. Dipstick test positive for leukocyte esterase and/or nitrate
 - ii. Pyuria
 - iii. Organisms seen on Gram stain of unspun urine
 - iv. Two urine cultures with repeated isolation of same uropathogen with $\geq 10^2$ organisms/ml urine in nonvoided specimens
 - v. Urine culture with $\leq 10^5$ colonies/ml urine of a single uropathogen in patient being treated with appropriate antimicrobial therapy
 - vi. Physician's diagnosis
 - vii. Physician institutes appropriate antimicrobial therapy

Asymptomatic bacteriuria must meet either of the following criteria:

1. An indwelling urinary catheter is present within 7 days before urine is cultured AND patient has no fever ($>38^{\circ}\text{C}$), urgency, frequency, dysuria or suprapubic tenderness AND has urine culture of 10^5 organisms/ml urine with no more than two species of organisms.
2. No indwelling urinary catheter is present within 7 days before the first of two urine cultures with $\geq 10^5$ organisms/ml urine of the same organism with no more than two species of organisms, AND patient has no fever ($>38^{\circ}\text{C}$), urgency, frequency, dysuria, or suprapubic tenderness.

Other infections of the urinary tract (kidney, ureter, bladder, urethra, or tissues surrounding the retroperitoneal or perinephric spaces) must meet one of the following criteria:

1. Organism isolated from culture of fluid (other than urine) or tissue from affected site

2. An abscess or other evidence of infection seen on direct examination, during surgery, or by histopathologic examination
3. Two of the following: fever($>38^{\circ}\text{C}$), localized pain, or tenderness at involved site AND any of the following:
 1. Purulent drainage from affected site
 2. Organism isolated from blood culture
 3. Radiographic evidence of infection*
 4. Physician's diagnosis
 5. Physician institutes appropriate antimicrobial therapy
4. Patient ≤ 12 months of age has one of the following: fever ($>38^{\circ}\text{C}$), hypothermia ($<37^{\circ}\text{C}$), apnea, bradycardia, lethargy, or vomiting AND any of the following:
 - i. Purulent drainage from affected site
 - ii. Organism isolated from blood culture
 - iii. Radiographic evidence of infection
 - iv. Physician's diagnosis
 - v. Physician instituted appropriate therapy

***For urine specimens to be of value in determining whether a nosocomial infection exists, they must be obtained aseptically using an appropriate technique, such as clean catch collection, bladder catheterization, or suprapubic aspiration.**

+Gram-negative bacteria of *Staphylococcus saprophyticus*

5. Clinical Diagnostic Criteria of Urosepsis and Uroseptic Shock used in the GPIU study

Disorder	Definition
Urosepsis (simple)	<p>Activation of a systemic inflammatory response syndrome (SIRS) due to a urinary tract infection (UTI). This systemic response is manifested by two or more of the following conditions:</p> <p>Temperature > 38°C or < 36°C Heart rate > 90 beats min Respiratory rate > 20 breaths/min or PaCO₂ < 32mmHg (< 4.3kPa) WBC > 12,000 cells/mm³ or < 4,000 cells/mm³ or ≥ 10% immature (band) forms</p>
Severe Urosepsis	<p>Urosepsis associated with organ dysfunction, hypoperfusion or hypotension.</p> <p>Hypoperfusion and perfusion abnormalities may include but are not limited to lactic acidosis, oliguria or an acute alteration of mental status</p>
Uroseptic Shock	<p>Urosepsis with hypotension despite adequate fluid resuscitation along with the presence of perfusion abnormalities that may include, but are not limited to lactic acidosis, oliguria, or an acute alteration in mental status.</p> <p>Patients who are on inotropic or vasopressor agents may not be hypotensive at the time that perfusion abnormalities are measured</p>
