

Additional File 1: Effects of treatment on tumor. Tumor death is evaluated with H&E staining. Live tumor areas are enclosed within double lines. A single OXi4503 treatment has an immediate effect on tumor death reaching a maximum at 24 hrs. By day five there is regrowth of the tumor into the necrotic centre. Continuous Sunitinib treatment has a gradual reducing effect on live tumor but it does not reach the levels of tumour killing seen by the OXi4503 treatment at 24 hrs.
