Supplementary Table 6. Details of discordant cases between SRM-MS and IHC/ISH after central ISH retest.

SRM-MS cat: Negative, <740 amol μ g; Positive, >740 amol μ g. HER2 status local: Positive, IHC positive (3+) or ISH amplified (IHC equivocal). HER2 status central: Positive, ISH amplified; Negative, ISH non amplified. In **bold** discordant cases between SRM-MS and ISH after central re-test. DM, double minutes; MIX, mixed pattern. SR, surgical resection; RD, recurrent disease. IDC, invasive ductal carcinoma; HR, Hormone receptors. POS, positive; NEG, negative. ¹results based on literature data.

Supplementary Table 7. HER2 expression levels by SRM, HER2 gene copy number (GCN) and HER2/CEP17 ratio in ISH-positive breast cancer.

SD, standard deviation. ZR 75-30 cell line was not included in the analysis as central ISH re-test was not available.

| | N | Mean | SD | Min | Max |
|-----------------------------------|----------|-------------|-----------|------------|------------|
| Her2 amolμg | 123 | 4047.1 | 3508.9 | 272.8 | 17446.7 |
| HER2 GCN | 123 | 14.0 | 4.2 | 5.2 | 22.2 |
| HER2/CEP17 Ratio | 123 | 7.2 | 2.5 | 2.1 | 15.0 |

Supplementary Table 8. HER2 expression levels by SRM-MS according to amplification pattern.

DM, double minutes; HSR, homogeneously stained regions; MIX, mixed pattern. SD, standard deviation. ¹Kruskal-Wallis rank sum test.

| | | Her2 (amol/μg) | | | | | |
|--------------------------|------------|-----------------------|-----------|------------|------------|----------------|----------------------------|
| | | Mean | SD | Min | Max | N total | P-value¹ |
| Pattern of amplification | DM | 2176.4 | 1908.1 | 272.8 | 8070.0 | 46 | <0.001 |
| | HSR | 5462.9 | 3368.4 | 1099.3 | 17446.7 | 50 | |
| | MIX | 4612.1 | 4439.6 | 287.8 | 16303.3 | 27 | |

Supplementary Table 9. Distribution for pattern of HER2 amplification in SRM-MS negative (<740) and positive (>740) tumors.

DM, double minutes; HSR, homogeneously stained regions; MIX, mixed pattern.

| | | DM | MIX | HSR | |
|---------------------------------|------|-----------|------------|------------|-----|
| HER2 (amol/μg) | <740 | 8 | 2 | 0 | |
| | >740 | 38 | 25 | 50 | |
| Total | | 46 | 27 | 50 | 123 |

Supplementary Table 10. ROC analysis.

The optimal cutoff for HER2 levels by SRM-MS, HER2/CEP17 ratio and HER2 GCN discriminating between a positive or negative result, in terms of response to treatment and prolonged survival, was determined using ROC analysis. Patients were dichotomized into good responders (absence of disease progression at last follow up) or poor responders (presence of disease progression at last follow up) and into good survival (alive at last follow up) versus poor survival (dead at last follow up) groups. The cutoff values of HER2 amol/ μ g of 2200, HER2/CEP17 ratio of 6.4 and HER2 GCN of 12.50 were chosen as the optimal cutoff values for survival analyses. The HER SRM of 2200 amol/ μ g threshold represents an intermediate value between optimal thresholds distinguishing good versus poor survival (2110.25 amol/ μ g) and good versus poor responders (2302.25 amol/ μ g) in the adjuvant population. The sensitivity and specificity of this threshold in predicting survival was 100% and 65.57% in the adjuvant setting, and 56.25% and 100% in the metastatic setting. AUC: Area under ROC curve.
