

Supplementary Data

SUPPLEMENTARY FIG. S1. Population-based HIV surveillance community viral load samples used for the analysis of primary drug resistance. The final numbers for 2011 and 2012 represent samples from cART-naïve patients with viral load greater than 10,000 RNA copies/ml. *The WHO minimal sequential sampling strategy was used for 2010. The focus was to genotype recently infected individuals identified through seroconversion in serial testing in an annual population-based HIV surveillance. HIV, human immunodeficiency virus; WHO, World Health Organization.
