

Tao et al. Supplemental figure S2

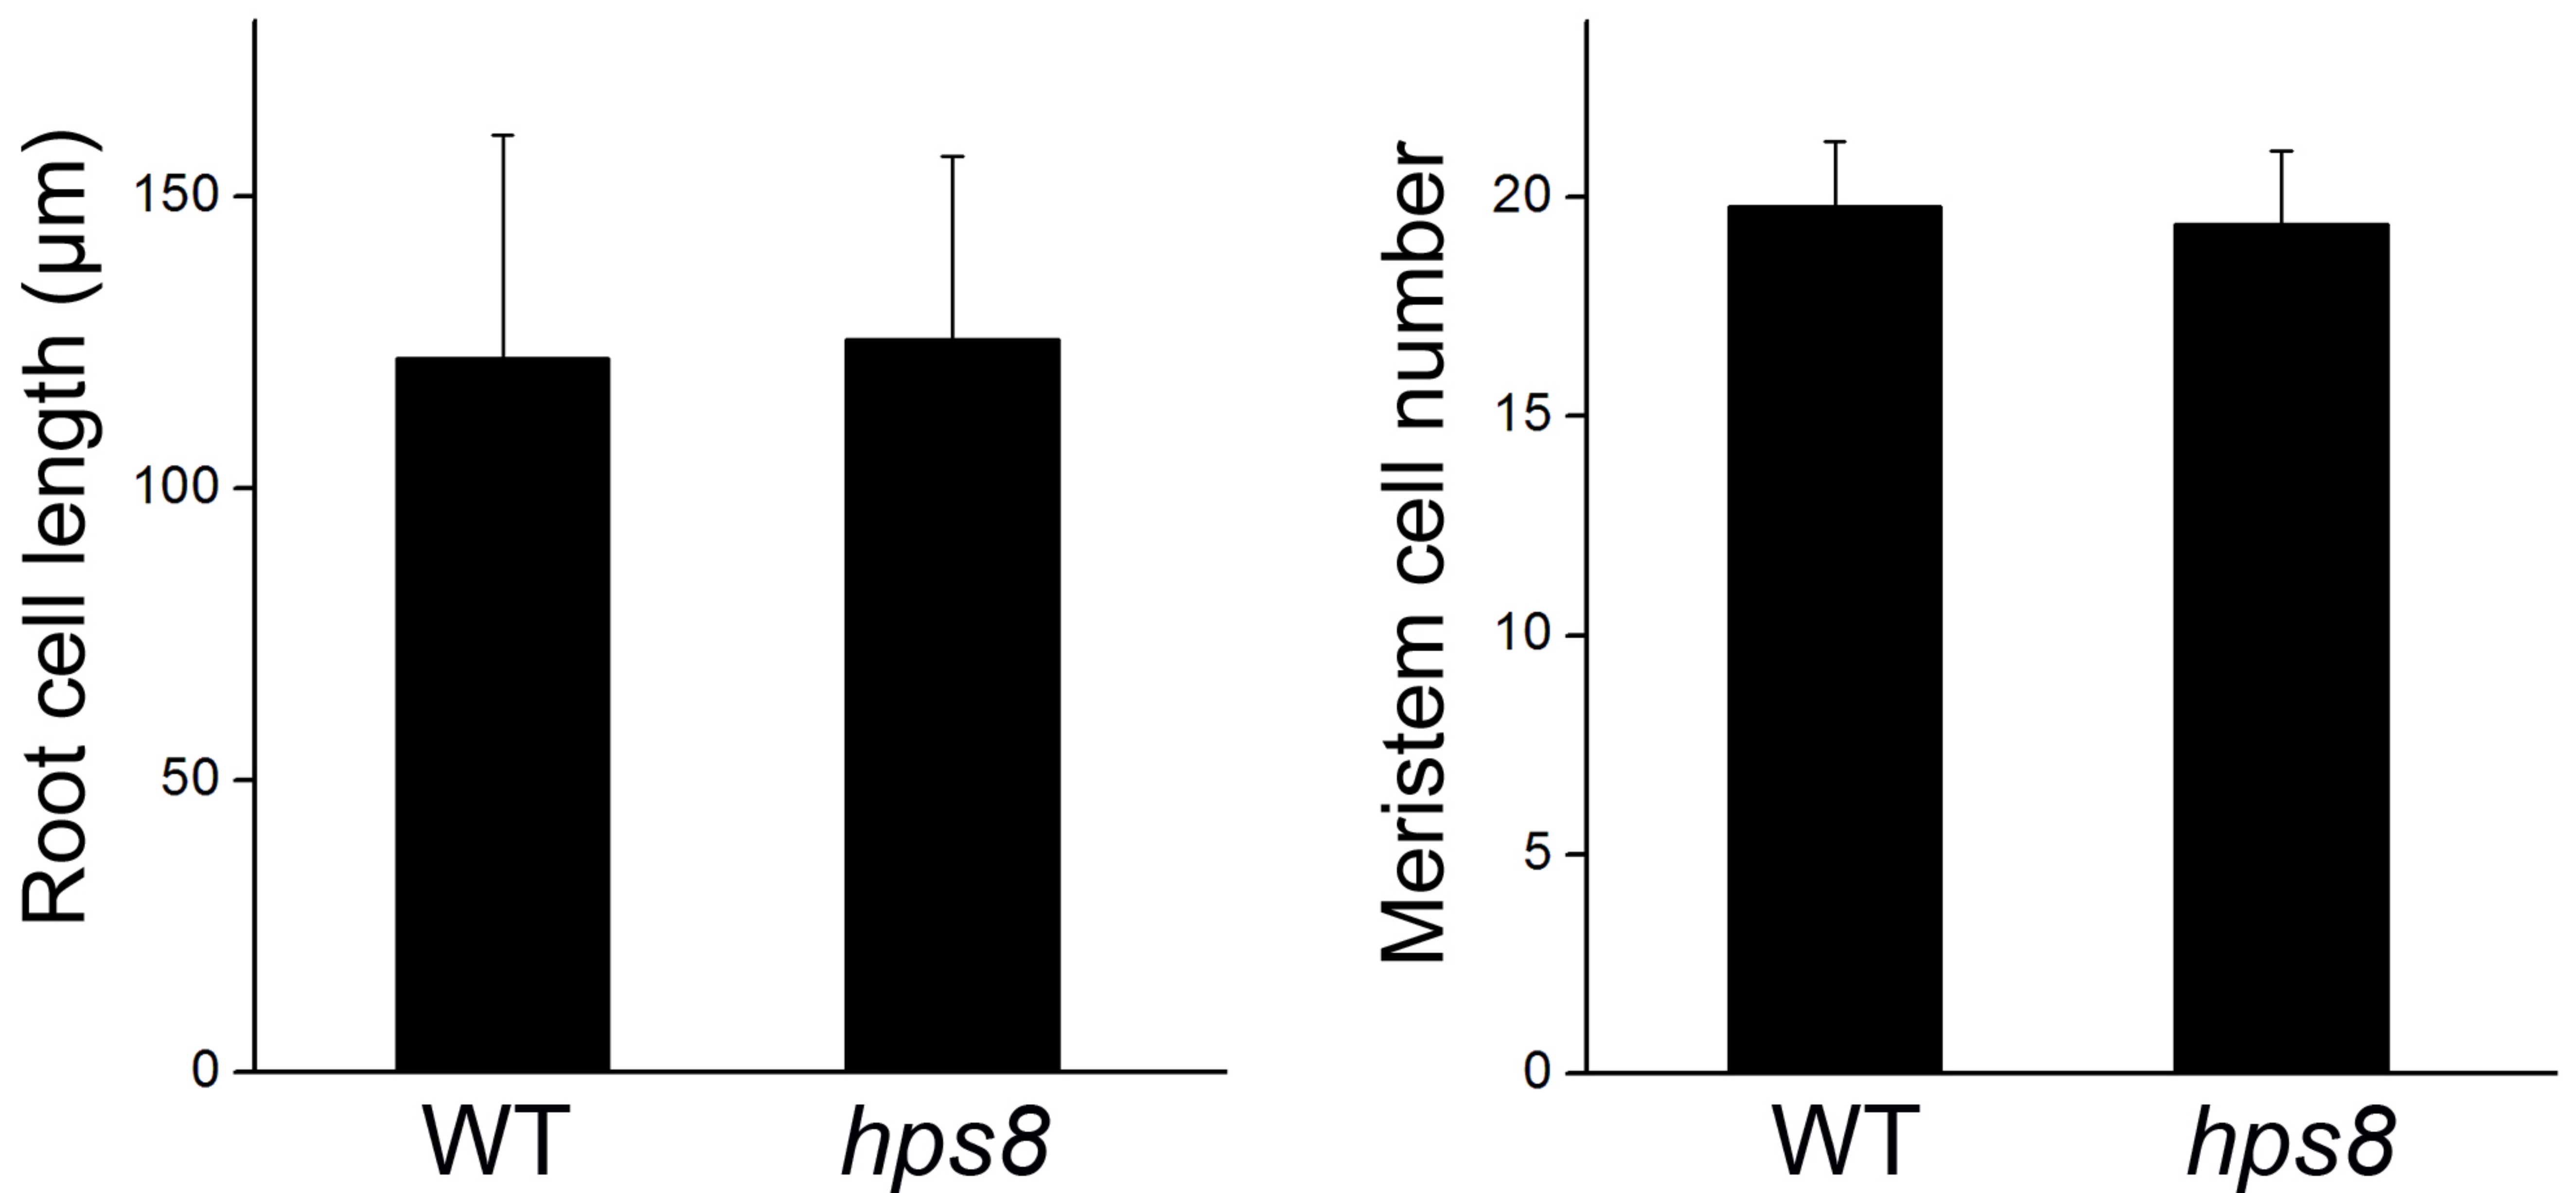

Figure S2. The root cell length and root meristem size of the 8 day-old seedlings of the WT and *hps8* grown under normal growth conditions. For root cell length, the values are the means \pm SE of 20 seedlings (5 root epidermal cells were measured per seedling). For root meristem size, the number of root meristem was determined by counting the number of cortex cells in a file extending from the quiescent center to the first elongated cell. Values are means \pm SE ($n > 20$).
