eMethods. Description of Samples and Analyses

Description of Yale-Penn sample

Families were ascertained from treatment centers and advertisements that recruited affected sibling pairs (ASPs) meeting Diagnostic and Statistical Manual of Mental Disorders, 4th Edition (DSM-IV) criteria for CD or OD. Probands were excluded from further study if they had ever received a clinical diagnosis of a major psychotic illness (for example, schizophrenia or schizoaffective disorder). Other family members of the ASPs were recruited when available, regardless of affection status. The case-control subjects were recruited from substance abuse treatment centers and through advertisements at the University of Connecticut Health Center, Yale University School of Medicine, the Medical University of South Carolina, the University of Pennsylvania, and McLean Hospital.

Additional quality control information for the Yale-Penn sample

Genetic relationships were examined by calculating pairwise identity by descent (IBD) proportion estimates using PLINK¹. Pairs of individuals whose IBD proportions did not match their reported genetic relationship were assigned to two different families and pairs of individuals who shared more than 25% of their alleles IBD were assigned to the same family. Self-reported males with X chromosome heterozygosity > 20% and self-reported females with heterozygosity < 20% were excluded unless their true identity could be determined. These analyses also identified instances where two identical DNA marker profiles were linked to two different interview forms. When demographic information (sex, date of birth, number of reported children) was consistent across interviews, one sample was randomly removed from analysis. Both samples were removed if the demographic information was inconsistent across interviews. In total, 104 DNA samples were removed from analysis due to an inability to definitively assign them to the correct phenotype data.

Description of SAGE sample

The COGA sample² is a set of unrelated individuals recruited in Indiana, New York, St. Louis, Connecticut, Iowa, and San Diego selected for genotyping from a larger set of 8,000 subjects. Cases met criteria for DSM-IV alcohol dependence. FSCD² contained cases and controls from the greater St. Louis metropolitan area. All cases met criteria for DSM-IV alcohol dependence and most also met criteria for DSM-IV cocaine dependence. Controls were from the same

communities and had consumed alcohol, but had no lifetime history of dependence on any substance. A subgroup of FSCD subjects was not alcohol dependent, but had a lifetime diagnosis of DSM-IV CAD or dependence on another illicit drug. COGEND³ subjects were recruited in MO and MI. Cases met criteria for DSM-IV alcohol and/or nicotine dependence. Control subjects were selected from the non-dependent population and did not meet criteria for alcohol, nicotine, or illicit drug dependence.

Description of the ICGHD Sample

All International Consortium on the Genetics of Heroin Dependence subjects with informative DSM-IV CAD criteria counts came from The Comorbidity and Trauma Study,⁴ a retrospective case-control study examining genetic and environmental factors contributing to heroin dependence liability. Case participants were recruited from maintenance clinics in the greater Sydney area. Control participants were recruited from employment and community centers, open street malls, and local press servicing the same geographical area as the opioid maintenance treatment clinics and either denied recreational use of opioids or had used these drugs recreationally fewer than 11 times lifetime. The prevalence in these individuals of non-opioid licit drug dependence and illicit drug dependence as well as childhood trauma exposure and other psychiatric disorders is elevated considerably versus estimates of similar measures in Australian general population samples. Participants provided blood samples as a source of DNA and completed a comprehensive psychiatric diagnostic interview based on the Semi-Structured Assessment of the Genetics of Alcoholism - Australia (SSAGA-OZ) augmented with sections drawn from other instruments assessing childhood trauma exposure, family history, and screening for borderline personality disorder.

Genotyping and Quality Control

The entire Yale-Penn sample was genotyped using one of two genotyping arrays: (1) the Illumina HumanOmni1-Quad v1.0 microarray containing 988,306 autosomal SNPs (Yale-Penn.1: performed at the Center for Inherited Disease Research (CIDR) and the Yale Center for Genome Analysis), (2) the Illumina Infinium Human Core Exome microarray (Yale-Penn.2 and Yale-Penn.3: performed at the Yale Center for Genome Analysis), which contains 265,919 exome-focused SNPs and approximately 240,000 tagging SNPs which allow genome-wide imputation. The SAGE samples were genotyped using the Illumina Human 1M array containing 1,069,796 total SNPs and the ICGHD samples were genotyped using the Illumina

Human610_Quadv1_B. All QC and subsequent analyses were performed separately within individuals genotyped on the platforms listed above. Samples and SNPs with genotype call rates < 98% were removed. Additional samples were removed due to excess heterozygosity taken to indicate possible contamination, and identification as possible population outliers based on the calculation of principal components. Genotypes were called using GenomeStudio software V2011.1 and genotyping module V1.8.4 (Illumina, San Diego, CA, USA). SNPs with significantly different allele frequencies (within population) across genotyping centers were set to missing prior to imputation. After data cleaning and quality control, (Yale-Penn.1: 711,711; Yale-Penn.2: 261,746; Yale-Penn.3: 327,405, SAGE: 726,191, ICGHD: 551,134) SNPs and (Yale-Penn.1: 5,697; Yale-Penn.2: 2,591; Yale-Penn.3: 683, SAGE: 3,890, ICGHD: 1,893) samples remained for imputation.

To verify and correct potential misclassification of self-reported race, we compared the GWAS data from all subjects with genotypes from the 1000 Genomes reference panel (1000 Genomes Project, 2012; <http://www.1000genomes.org/>), which contains phased haplotypes for 1,094 individuals of various ancestries: 379 of European descent (CEU, FIN, GBR, IBS, and TCI), 286 of Asian descent (CHB, JPT, and CHS), 181 admixed American samples (PUR, CLM, and MXL), and 246 samples of African descent (ASW, LWK, YR). Principal components (PC) analysis was conducted in the entire GWAS sample using Eigensoft^{5,6} and SNPs that were common to the each of the five individual genotyping arrays and the 1000 Genomes panel (after pruning the GWAS SNPs for linkage disequilibrium (LD), $r^2 > 80\%$) to characterize the underlying genetic architecture of the samples. Individuals were clustered according to the 1000 Genomes cohort whose centroid was nearest across the first 10 PCs. Those samples that didn't cluster with either AAs or EAs were removed from downstream analysis. We then conducted PC analyses within the two remaining groups and removed any outliers beyond three standard deviations from the mean. The first three PCs were used in all subsequent analyses to correct for residual population stratification.

Genotype Imputation

SNP genotype imputation was performed in the Yale-Penn, SAGE, and ICGHD GWAS cohorts with IMPUTE2⁷ using genotyped SNPs and the March 2012 1000 Genomes reference panel (1000 Genomes Project, 2012; <http://www.1000genomes.org/>), which contains phased haplotypes for 1,094 individuals of various ancestries: 379 of European descent (CEU, FIN, GBR, IBS, and TCI), 286 of Asian descent (CHB, JPT, and CHS), 181 admixed American samples (PUR, CLM, and MXL), and 246 samples of African descent (ASW, LWK, YR). EA and AA samples were imputed separately within each cohort.

Power

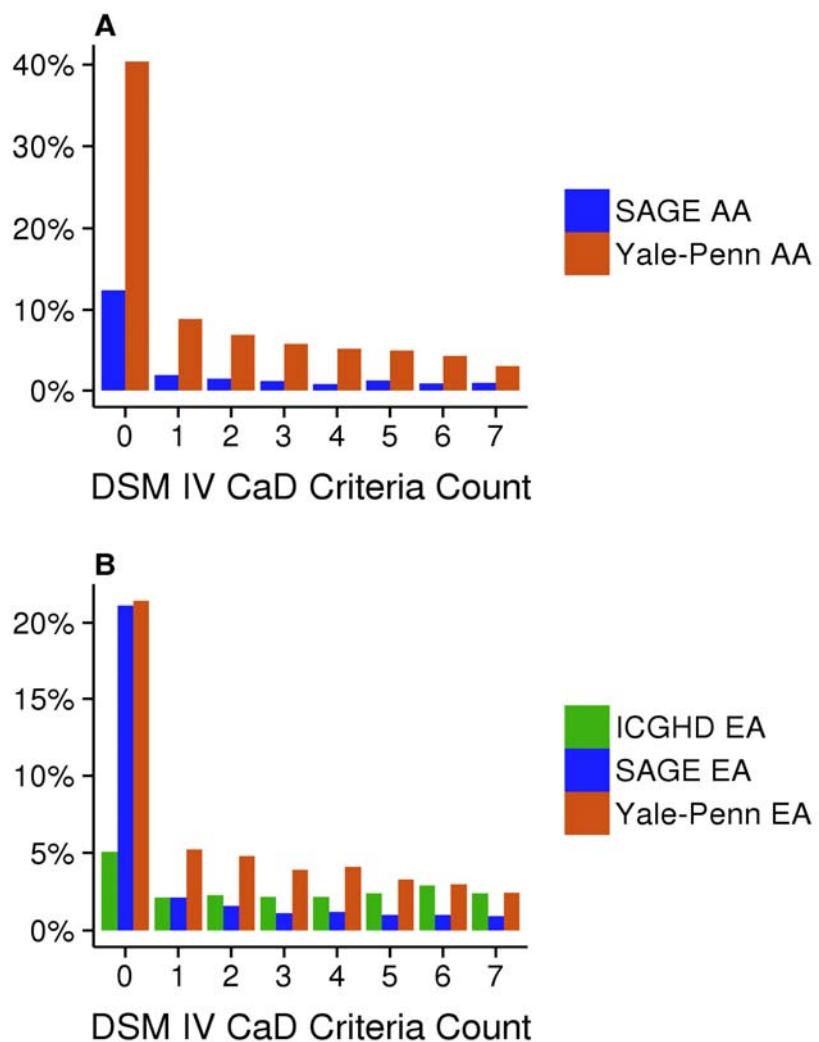

Power varied according to cohort and population. The largest (N=4,750) and best powered subsample was Yale-Penn AAs genotyped on the Illumina HumanOmni-Quad v1.0, in which we had 80% power to detect SNPs explaining 0.9% of the total variation in CAD symptom count at $p \leq 5 \times 10^{-8}$. SAGE AAs (N=1,250) had the lowest power, able to detect GWS SNPs explaining 3.2% of the total trait variance.

Distribution of DSM-IV cannabis dependence criteria counts in AAs (Panel A) and EAs (Panel B).

eFigure 2. Manhattan and quantile-quantile plots for DSM-IV cannabis dependence criteria count in the Yale-Penn.1-2+SAGE AA meta-analysis

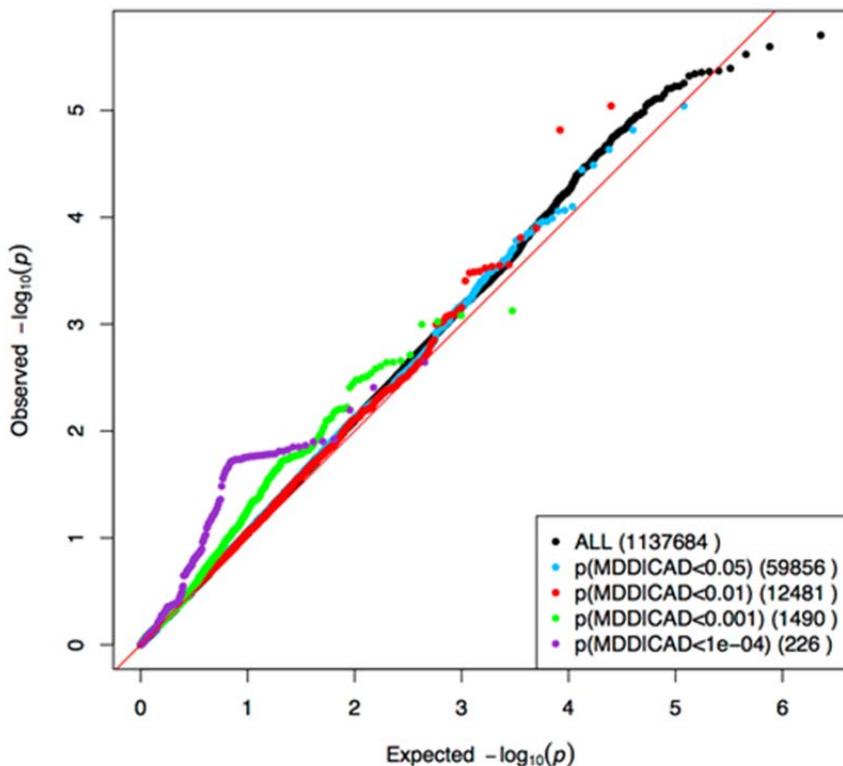

Manhattan and quantile-quantile plots for SNP minor allele dosage linearly regressed on DSM-IV cannabis dependence criteria count in the Yale-Penn+SAGE AA meta-analysis. The gold horizontal line corresponds to the $-\log_{10}$ of 5×10^{-8} , the threshold for genome-wide significance. The quantile-quantile plot shows the distribution of observed p-values compared to the expected distribution based on a uniform (0,1) distribution. λ is the ratio of the observed to the expected p-value at the median SNP.

eFigure 3. Manhattan and quantile-quantile plots for DSM-IV cannabis dependence criteria count in the Yale-Penn.1-2+SAGE EA meta-analysis

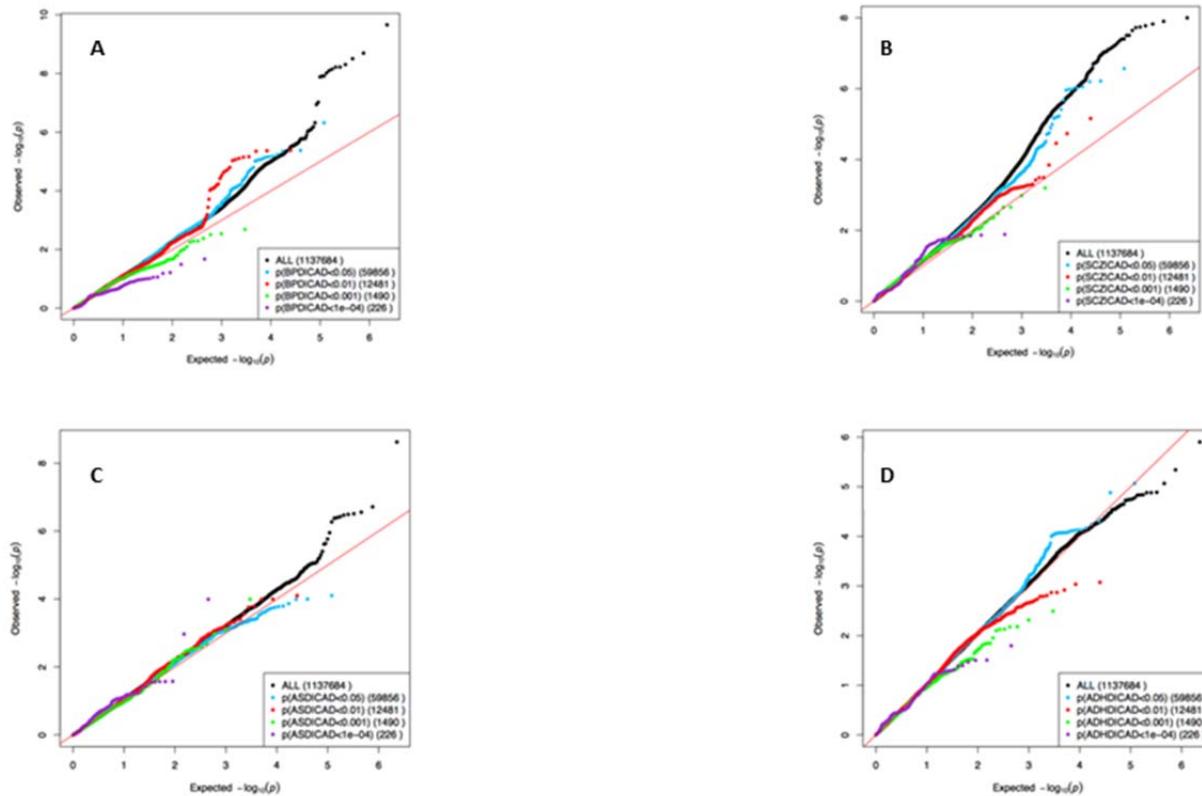

Manhattan and quantile-quantile plots for SNP minor allele dosage linearly regressed on DSM-IV cannabis dependence criteria count in the Yale-Penn+SAGE EA meta-analysis. The gold horizontal line corresponds to the $-\log_{10}$ of 5×10^{-8} , the threshold for genome-wide significance. The quantile-quantile plot shows the distribution of observed p-values compared to the expected distribution based on a uniform (0,1) distribution. λ is the ratio of the observed to the expected p-value at the median SNP.

eFigure 4. Quantile-quantile plot showing the observed vs. expected distribution of p-values for major depressive disorder for SNPs associated with cannabis dependence

Quantile-quantile plot showing the observed distribution of p-values for major depressive disorder from the Psychiatric Genomics Consortium sample for subsets of SNPs associated with cannabis dependence in the meta-analysis of Yale-Penn and SAGE (black dots represent all SNPs with a valid association result for both cannabis dependence and major depressive disorder, blue dots represent SNPs associated with cannabis dependence at $P < .05$, red dots at $P < .01$, green dots at $P < .001$, and purple dots at $P < .0001$) compared to the expected distribution based on a uniform (0,1) (red line). The number of SNPs observed at each threshold is shown in parentheses in the inset.

eFigure 5. Quantile-quantile plot showing the observed vs. expected distribution of p-values for other psychiatric disorders for SNPs associated with cannabis dependence

Quantile-Quantile plots showing no enrichment for association with bipolar affective disorder (panel A), schizophrenia (panel B), autism spectrum disorder (panel C), and attention deficit hyperactivity disorder (panel D) among SNPs associated with cannabis dependence at various p-value thresholds (black dots represent all SNPs with a valid association result for both cannabis dependence and the other trait, blue dots represent SNPs associated with cannabis dependence at $P < .05$, red dots at $P < .01$, green dots at $P < .001$, and purple dots at $P < .0001$) compared to the expected distribution based on a uniform (0,1) (red line). The number of SNPs observed at each p-value threshold is shown in parentheses in the inset. The P values for the other psychiatric disorders are from the Psychiatric Genomics Consortium.

eTable 1. SNPs associated with DSM-IV cannabis dependence with $p < 1.0 \times 10^{-5}$ in the AA, EA or combined meta-analysis by analysis group and including secondary analysis results.

^abase pair position in human genome assembly build 37

^beffect allele

^creference allele

^deffect direction of A1. The order of the symbols is: Yale-Penn OMNI AA, SAGE AA, Yale-Penn HCE AA, Yale-Penn OMNI EA, SAGE EA, Yale-Penn HCE EA.

^eAll P = p-value from the primary analysis model with cannabis unexposed individuals included

^fExp P = p-value from model with only cannabis exposed individuals

^gAdj P = p-value from primary analysis model adjusted for the DSM-IV criteria counts for alcohol, cocaine, and opioid dependence.

P-values < 0.05 are in bold italics.
