

Fig. S2. Phenotypic fitness measurements taken for four *Arabidopsis thaliana* genotypes grown in experimental repeats 1 and 2 and in the presence and absence of *Hyaloperonospora arabidopsidis* (*Hpa*). **a)** Mean rosette diameter after five weeks growth. **b)** Mean number of days taken to flower. **c)** Mean seed mass produced per plant averaged over all four genotypes. **d)** The logarithm of response ratios (\ln RR) an indicator of competitive ability. Error bars show 95% confidence interval of mean.
