Supplemental Figure 2 – Visualizing remnant cones in a retina with the most severe OCT phenotype. Shown are confocal (***left***) split detector (***center***), and merged (***right***) images from a subject (PCI-003) with a grade V OCT, acquired just outside of the atrophic foveal lesion. Remnant cone structure is visible as dark gaps in the confocal image and inner segment structures in the split-detector image (*arrows*), with a contiguous rod mosaic amongst the sparse cone mosaic. Scale bar= 50µm.
