

Quantitative phosphoproteomics reveals the role of SnRK1 as metabolic master regulator under energy deprivation

Ella Nukarinen^{1,*}, Thomas Nägele^{1,2,*}, Lorenzo Pedrotti^{3,*}, Bernhard Wurzinger¹, Andrea Mair¹, Ramona Landgraf⁴, Frederik Börnke^{4,5}, Johannes Hanson⁶, Markus Teige¹, Elena Baena-Gonzalez⁷, Wolfgang Dröge-Laser³, Wolfram Weckwerth^{1,2}

Supplementary Figure S1. (a) Abundance of SnRK1 α 1 in Col-0 wild type, *snrk1 α 1* ko, Ler wild type, SnRK1 OE1, and SnRK1 OE2. Immunodetection was done with anti-AKIN10 antibody. (b) The expression of SnRK1 α 1 in Col-0 and *snrk1 α 1/ α 2* in the time series experiment for 3 time points (Light, 0 min and 360 min of extended night) is shown with anti-AKIN10 antibody. (c) Phenotype of Col-0 wild type, *snrk1 α 1* and *snrk1 α 1/ α 2* mutants in 12 h/12 h day/night cycle. Knocking down of SnRK1 α 2 was started after 22 days after germination (DAG). Plants were either sprayed with 10 μ M β -estradiol or with same solution without β -estradiol. SnRK1 α 2 protein is relatively stable and it decreases after 5-6 days after start of β -estradiol treatment (Pedrotti et al. in preparation). The knock down of SnRK1 α 2 is labelled as day 6 + number of days of knock down.

Supplementary Figure S2. Comparison of phosphorylated proteins in *snrk1α1/α2* mutant and *snrk2.2/2.3/2.6* triple mutant (Wang, P. et al. (2013) Quantitative phosphoproteomics identifies SnRK2 protein kinase substrates and reveals the effectors of abscisic acid action. Proc Natl Acad Sci USA 110, 11205-11210). All values of the dark time points were averaged and compared to the averaged light values (fold change >1.5 and <0.67).
