

## Item S1: Definitions of atherosclerotic and non-atherosclerotic vascular events

### *Atherosclerotic vascular event*

Major atherosclerotic event (MAE):

- Major coronary events: non-fatal myocardial infarction or coronary death
- Ischaemic stroke
- Arterial revascularization: coronary or non-coronary (excluding interventions on haemodialysis access)

Plus:

- Other atherosclerotic coronary events: unstable angina, heart failure related to ischaemic heart disease
- Other atherosclerotic cerebrovascular events: transient ischaemic attack, amaurosis fugax, retinal artery occlusion
- Other atherosclerotic peripheral arterial disease:
  - aortic aneurysm (including rupture and dissection)
  - limb ischaemia, limb artery embolism or thrombosis

### *Non-atherosclerotic vascular event*

Non-atherosclerotic cardiac events:

- Non-coronary cardiac death
- Heart failure not related to ischaemic heart disease (hypertrophic cardiomyopathy, cor pulmonale)
- Arrhythmias: atrial fibrillation, ventricular tachycardia, other tachycardia, bradycardia/heart block, other arrhythmia, cardiac arrest
- Valvular heart disease (including valve repair or replacement)
- Pericardial disease: pericarditis, effusion

Other non-atherosclerotic events:

- Haemorrhagic stroke
- Subarachnoid haemorrhage
