

Supplementary Fig. 2. The time required to achieve of complete remission (CR) and the time to relapse after CR in patients with gastric mucosa-associated lymphoid tissue (MALT) lymphoma. (A) Cumulative CR rate. The median time to CR was 9.9 months. (B) The cumulative CR rate according to *Helicobacter pylori* infection status (log-rank, $p=0.079$). The median time to CR was 9.8 months for *H. pylori*-positive patients and 11.5 months for *H. pylori*-negative patients. (C) The cumulative CR rate according to stage. The time to CR did not differ based on the disease stage (log-rank, $p=0.831$). (D) The cumulative relapse rate. The median time to relapse was 11.5 months. (E) The cumulative relapse rate according to *H. pylori* infection status (log-rank, $p=0.898$). The median time to relapse was 11.5 months for *H. pylori*-positive patients and 8.1 months for *H. pylori*-negative patients. (F) The cumulative relapse rate according to disease stage. The time to relapse did not differ among the disease stages (log-rank, $p=0.579$).
