^a TCID₅₀/mL were for viral targets and CFU/mL were for Cryptococcus target.

^b Four Enterovirus groups (A, B, C, and D) were evaluated separately; the range of results is shown.

^c Units are in copies/mL.

^d Two *Cryptococcus* species (*C. neoformans* and *C. gattii*) were evaluated separately; the range of results is shown.

Abbreviations: TCID50/mL, tissue culture infective dose 50 percent/ mL; CFU/mL, colony forming units/mL; Cq, Quantification Cycle (analogous to Ct, Cycle Threshold)

^a Additional analyses may have included a 2nd commercially available PCR assay performed at BioFire (target gene), repeat testing with FA or comparator testing, or results of testing done at trial sites as standard of care. Investigational testing was limited by specimen volumes.

^b Antimicrobial or other chemotherapeutics (antivirals) given within 24 hours prior to collection of CSF by spinal tap.

^c Information collected for discrepancy investigation from additional review of the medical record by each trial site to determine the final clinical diagnosis.

^d Final resolution determined as agreement with 2 of 3 results: 1) FA testing, 2) comparator testing, and 3) composite findings from Gram stain, additional analysis/supplemental testing, and final clinical diagnosis.

^e Immune status was determined and categorized as follows according to 2013 Infectious Diseases Society of America Guidelines.¹³

0. Immunocompetent
1. Combined primary immunodeficiency disorder (e.g., severe combined immunodeficiency)
2. Receiving cancer chemotherapy
3. Within two months after solid organ transplantation or receiving augmented immunosuppression for rejection
4. With Human Immunodeficiency Virus (HIV) infection with a CD4 T-lymphocyte count <200 cells/mm³ for adults and adolescents and percentage <15 for infants and children
5. Receiving daily corticosteroid therapy with a dose ≥20 mg (or >2 mg/kg/day for patients who weigh <10 kg) of prednisone or equivalent for ≥14 days
6. Receiving certain biologic immune modulators, that is, a tumor necrosis factor-alpha (TNF-α) blocker or rituximab
7. Premature birth with a corrected gestational age <40 weeks
8. Infants <30 days who are full term

^aImmune Status: Immune status was determined and categorized as follows according to 2013 Infectious Diseases Society of America Guidelines.(13)

1. Combined primary immunodeficiency disorder (e.g., severe combined immunodeficiency)
2. Receiving cancer chemotherapy
3. Within two months after solid organ transplantation or receiving augmented immunosuppression for rejection
4. With Human Immunodeficiency Virus (HIV) infection with a CD4 T-lymphocyte count <200 cells/mm³ for adults and adolescents and percentage <15 for infants and children
5. Receiving daily corticosteroid therapy with a dose ≥20 mg (or >2 mg/kg/day for patients who weigh <10 kg) of prednisone or equivalent for ≥14 days
6. Receiving certain biologic immune modulators, that is, a tumor necrosis factor-alpha (TNF-α) blocker or rituximab
7. Premature birth with a corrected gestational age <40 weeks
8. Infants <30 days who are full term
9. Other (with description)

^bAntimicrobial or other chemotherapeutics (antivirals) given within 24 hours prior to collection of CSF by spinal tap
