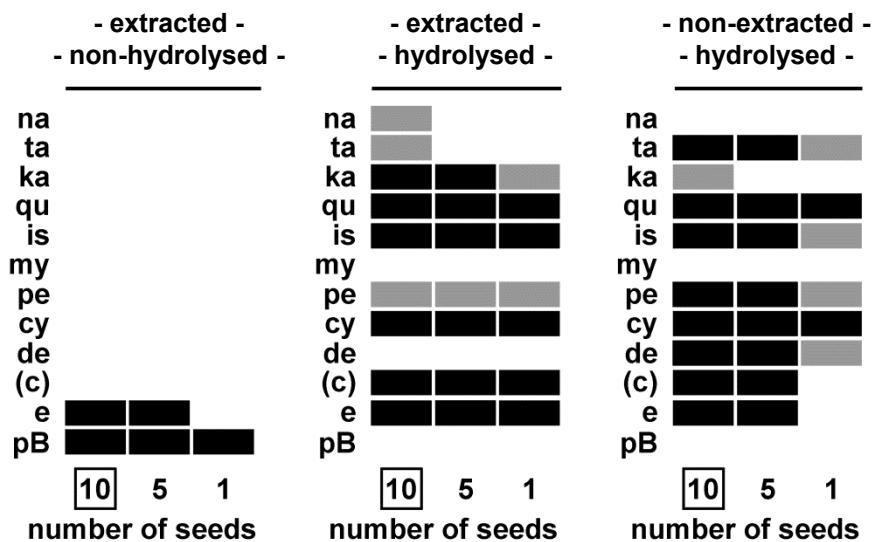

Figure S9: Reduction of seed material down to one seed – repetition.
Flavonoids detected in the three seed samples, extracted non-hydrolysed, extracted hydrolysed, and non-extracted hydrolysed. Filled boxes represent that more than half of the replicates passed LOQ (black) or LOD (grey), respectively. Square box represent the seed number chosen.

ta: taxifolin, ka: kaempferol, qu: quercetin, is: isorhamnetin, my: myricetin, pe: pelargonidin, cy: cyanidin, de: delphinidin, c: catechin, e: epicatechin, pB: procyanidinB2.

For experimental procedures see methods, text and Fig. 4. Note that peak areas and statistics are only determined when LOQ was passed. Only substances are shown for which at least for one seed number LOQ was passed for a given sample type.

"n.d." = not determined. "na" = naringenin, "ta" = taxifolin, "ka" = kaempferol, "qu" = quercetin, "is" = isorhamnetin, "my" = myricetin, "pe" = pelargonidin, "cy" = cyanidin, "de" = delphinidin, "c" = catechin, "e" = epicatechin, "pB" = procyanidin B2. For LOD/LOQ see methods. "Normalized response" = normalized to the respective internal standard. "*" = for all other seed numbers: $P>0.05$. Please note, this excludes seed numbers for which LOQ is not passed. For all, significance was determined using the Welch test.
