MBP DAPI

Dose Response Curve

Fig. S1

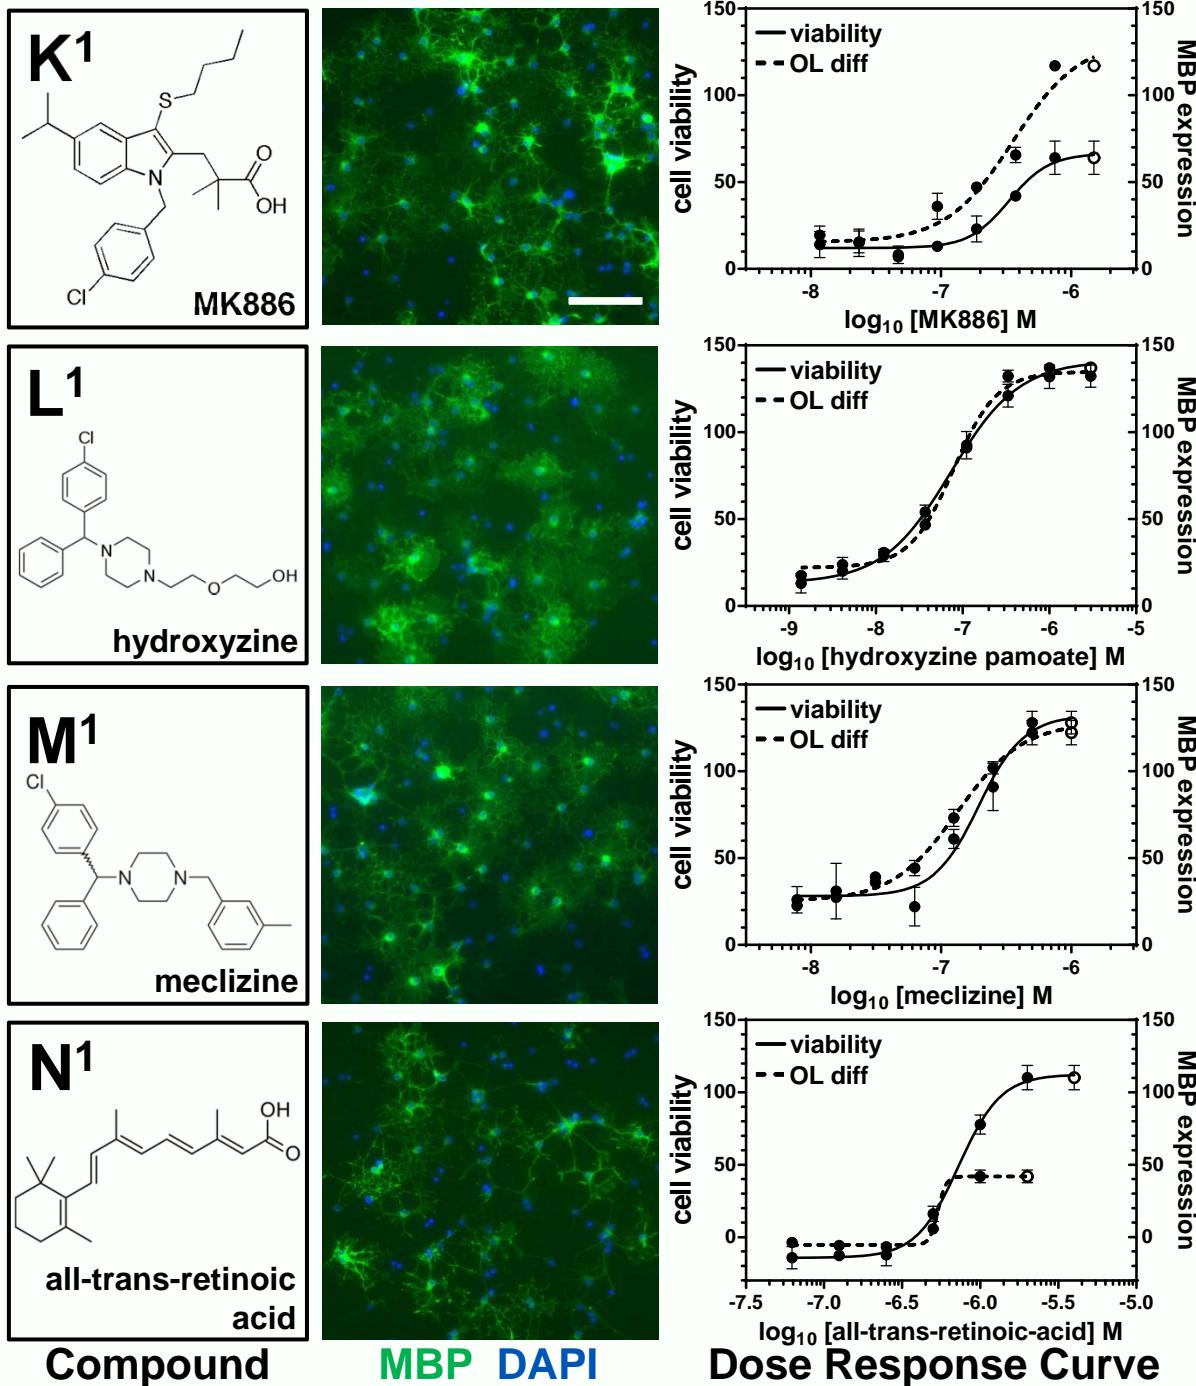

Fig. S1

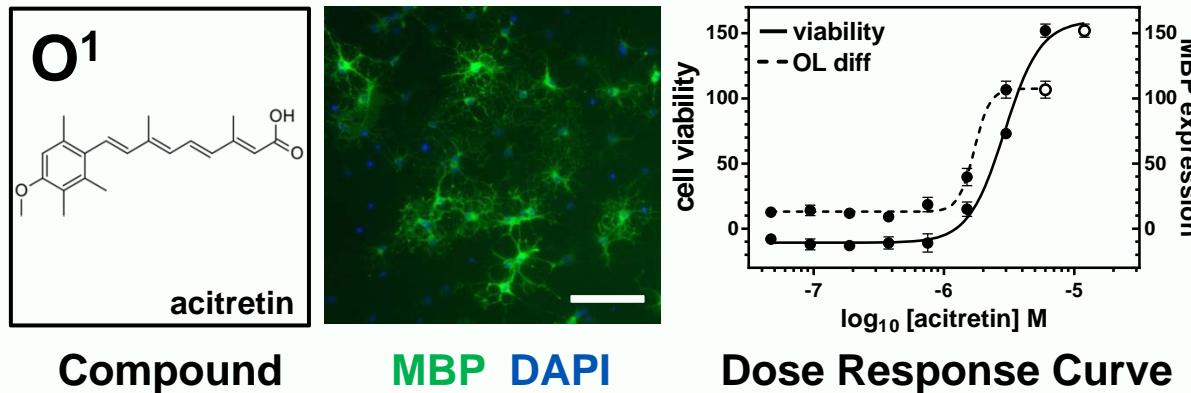

Figure S1. Structures, images, and EC₅₀s of cytokine protection hits. A-O¹ first column, Chemical structure and name of each hit compound and 0.1% DMSO. A-O¹ second column, Example image of each hit compound at the most efficacious concentration showing MBP (green) and DAPI (blue) staining. Bar = 100 μ M. A-O¹ third column, Representative dose-response curves of viability (solid lines) and OL differentiation (dashed lines) in cytokine protection assay for each hit compound. Open circles indicate points added to round off the curve. Note that no OL differentiation dose response curves are shown for the bifonazole, clotrimazole, econazole, and piaglitazone because they rescued survival but not MBP expression.
