Sample preparation for iTRAQ proteomic analysis, HILIC-HPLC fractionation of iTRAQ labelled peptides, mass spectrometry analysis, proteomic data identification, and proteomic data analysis

Sample preparation for iTRAQ proteomic analysis

The total protein concentration in the HCCF, post-Protein A eluate and flow through, post-cation eluate and post-anion flow through were determined using the method of Bradford³⁰ and, subsequently, 75 µg of total protein from each sample was processed for iTRAQ analysis. Samples were buffer exchanged using commercially available Vivaspin® columns (Sartorius UK, 5 kDa cut off) into triethylammonium bicarbonate, pH 8.5 (Sigma-Aldrich, Poole, Dorset), reduced, alkylated, and tryptically digested before being labelled with the appropriate iTRAQ label, according to manufacturer's instructions (ABSciex, Warrington, UK). Due to the cost and size of the 100 L wavebag experiment, technical sample replicates were analysed. Samples for each iTRAQ experiment were combined (experiment 1 – two replicates of HCCF, Protein A flow through, Protein A eluate; experiment 2 – two replicates of HCCF, Protein A eluate, cation exchange eluate and anion exchange flow through) then vacuum concentrated and fractionated by offline hydrophilic interaction liquid chromatography (HILIC)-HPLC, as described below.

HILIC-HPLC fractionation of iTRAQ labelled peptides

Peptide fractionation was performed using a 200 mm PolyHYDROXYETHYL-A (5 µm, 4.6 mm ID, 200 Å, PolyLC) analytical HILIC column (Columbia, MS, USA) using an Agilent 1100-series HPLC (Agilent, Berkshire UK) or U3000 HPLC system

(Thermo, Hemel Hempstead, UK). Samples were loaded, using a 45 min isocratic transfer flow-through at 500 µL/min, to remove non/low interaction analytes (HILIC transfer buffer A: 80% MeCN, 10 mM ammonium formate, pH 3.0). Enriched hydrophilic bound samples were eluted with elution buffer B (HILIC: 5% MeCN, 10 mM ammonium formate, pH 5.0; SCX: 25% MeCN, 0.5 M KCl, 0.1% formic acid), using a 3 step linear gradient at 0–20% B (5 min), 20–60% B (50 min) and 60–100% B (10 min), at 500 µL/min with samples collected at 1 min intervals. The column was isocratically eluted for a further 10 min in 100% B and, finally, re-equilibrated in 100% transfer buffer A. Chromatography was monitored *in situ* at 280 nm.

Mass Spectrometry Analysis

Individual HILIC fractions were injected into a nano-LC-ESI-MS/MS system for analysis. Mass spectrometry was performed using a Q-Star XL Hybrid ESI Quadrupole time-of flight tandem mass spectrometer, ESI-qQ-TOF-MS/MS (ABSciex, Warrington, UK), coupled to an online capillary liquid chromatography system (U3000 split loop system, Dionex/Thermo, UK). The peptide mixture was separated on a PepMap C-18 RP capillary column (Thermo, Hemel Hempstead, UK), with a constant flow rate of 0.3 µl/min. All samples were desalted online using a 5 cm, 300 µm i.d. C₁₈ PepMap trap cartridge using 0.1% TFA and 3% ACN for 15 min, and eluted to a 15 cm, 75 µm i.d., 3 micron pore size LC-Packings C18 PepMap analytical column. The flow rate was 0.3 µl/min. The amount of peptide loaded onto the column correspond to 500 ng – 1 µg, injected in a volume of 6 µl. The LC gradient started with 3% Buffer B (0.1% formic acid in 97% acetonitrile) and 97% Buffer A (0.1% formic acid in 3% acetonitrile) for 3 min, followed by gradient of 3–30% Buffer B over 90 min, then 90% Buffer B for 7 min, and, finally, 3% Buffer B

for 8 min. The mass spectrometer was set to perform data acquisition in the positive ion mode, with a selected mass range of 300–2,000 m/z. Peptides with +2 to +4 charge states were selected for tandem mass spectrometry, and the time of summation of MS/MS events was set to 3 sec. The two most abundantly charged peptides above a five count threshold were selected for MS/MS, and dynamically excluded for 60 sec. Two injections were performed for each HILIC fraction analysed (40 for 6 sample iTRAQ, 35 for 8 sample iTRAQ).

Proteomic data identification

Identification of peptide precursor and fragments was performed by database searching against the Uniprot Chinese Hamster Ovary database (downloaded Jan 2015, 23884 entries) to which the sequence of the recombinant mAb (heavy and light chains) had been added. Parameters for searching using MASCOT software (version 2.3, Matrix Science, London, UK) were set as follows: MS tolerance and MS/MS tolerances were set at 1.2 and 0.6 Da respectively, charge state +2, +3 and +4. Target database search space was restricted to tryptic peptides with a maximum of 1 missed cleavage. Modifications were set as: 8-plex iTRAQ mass shifts (fixed, +304 Da, K and N-term), methylthiol (fixed, +46 Da) and oxidation of methionine (variable, +16 Da). Reporter ion intensities were retrieved for all matched spectra and post-processing was carried out using Mathematica 10 software (Wolfram, Long Hanborough, UK). A false discovery rate (FDR) of 1% was set, using values determined by searching a reverse decoy database³¹. The list of confidently identified spectra were normalised using median correction, to account for technical variation between samples, then filtered to exclude PSMs from proteins with fewer than 3 unique peptides.

Proteomic data analysis

The proteomic analysis was undertaken in two parts: the first determined if a protein was present at a detectable level following each purification step, and the second looked quantitatively at how the levels of proteins varied between the different stages of purification. These two steps were carried out separately and then merged together to produce the final dataset. To determine protein presence/absence at the detectable level, two labels in the first iTRAQ experiment (113 and 121) were kept unused, to provide an experimental dataset to model noise in the system and establish a limit of detection. The mean value of all the background noise was used as a cut-off and any iTRAQ reporter ion intensities below this point were converted to 0 for the purpose of this part of the analysis. For each stage of purification, peptide spectral matches (PSMs) lacking relative quantifications for each replicate were removed from analysis. Any protein, with 3 or more unique peptides remaining after this were considered to be detectable at that purification stage.

To investigate changing protein amounts throughout purification, a value equal to 1% of the mean reporter ion intensity was added to all label quantifications for each PSM³² to account for absent reporter ions intensities, which may have significance in terms of protein amount. The proteins were then quantified by taking the mean of the log-transformed PSMs, and these data were used to produce heatmap figures investigating global effects, using the gplots package in R. A consistent drop/rise in the amount of protein at any stage of purification was determined if the following equations were evaluated as true:

$$\text{Decrease: } \text{Max}(A_i) - 0.9 \times \text{Min}(B_i) < 0$$

$$\text{Increase: } 0.9 \times \text{Min}(A_i) - \text{Max}(B_i) > 0$$

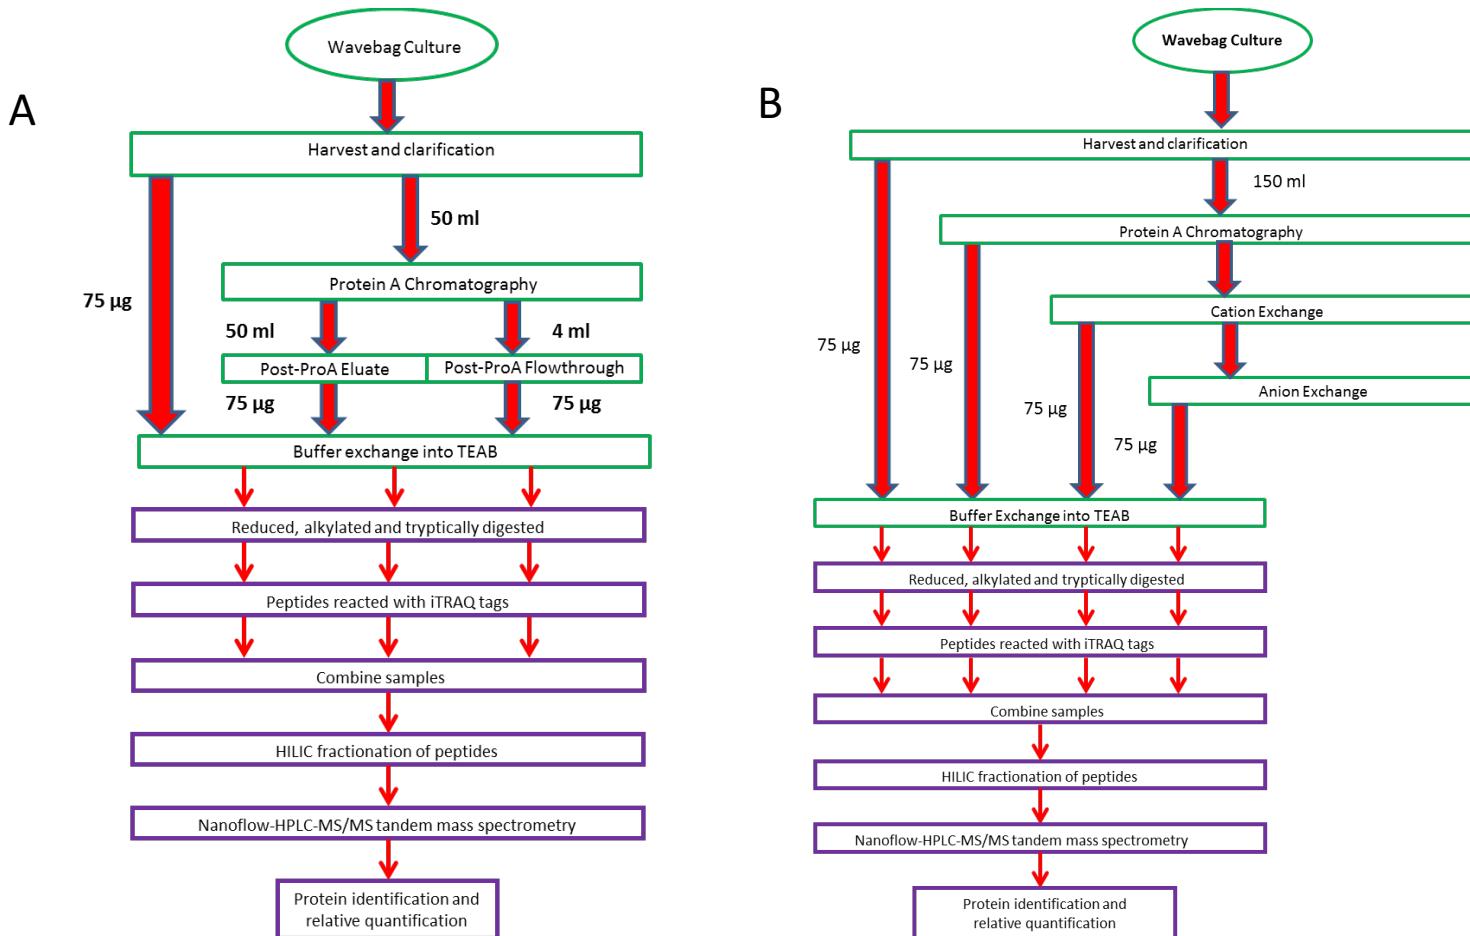

Where **A** and **B** are protein quants for the prior and posterior conditions respectively, and i indicates replicates. Both lists were then merged together, generating a list of proteins that were either consistently reduced or dropped below (our defined) limit of detection; as well as a list of proteins that were still detectable. Proteins that appeared to have increased in concentration relative to the previous stage were classed as preferentially retained.

Proteins were assigned as enriched or depleted during the process, using the following calculation based on analysis of mean iTRAQ ratio and taking replicates into account.

$\text{Max } [A_1, A_2] < 0.9 \text{ Min } [B_1, B_2]$ - Enriched in B relative to A

$0.9 \text{ Min } [A_1, A_2] > 0.9 \text{ Max } [B_1, B_2]$ – Depleted in B relative to A

Where A and B represent different sample types e.g. HCCF (A) or Protein A eluate (B). A 10% minimal clearance margin was included for stringency. The lists of proteins depleted and enriched, based on these criteria, are shown in Supplementary Table S3.

Supplementary Figure 1. Schematic representation of the experimental design for quantitative proteomics analysis of HCCF, post-Protein A flow through and eluate. A. iTRAQ labelling of duplicate samples of HCCF, post-Protein A flow through and eluate was performed followed by 2D LC peptide fractionation coupled to tandem mass spectrometry (LCMS/MS). B. iTRAQ labelling of duplicate samples of HCCF, post-Protein A eluate, post-cation exchange eluate and anion exchange flow through was performed. 2D chromatography coupled with tandem mass spectrometry (LC-MS/MS)-based was applied for protein identification and relative quantification.

Supplementary Table S3. Relative ratios of the heavy and light mAb chains during DSP. The mean ratio intensity values of the data are presented, calculated relative Protein A Eluate replicate 1, to which a ratio value of 1 was assigned.

Samples	Heavy:Light chain ratio
HCCF 1	0.50
HCCF 2	0.50
Protein A Eluate 1	1.00
Protein A Eluate 2	0.95
Cation Exchange Eluate 1	0.89
Cation Exchange Eluate 2	0.87
Anion Exchange Flow Through 1	0.85
Anion Exchange Flow Through 2	0.81
