

Table S1. Detailed sampling. For each *Rhithrogena* individual, the voucher name (voucher), the origin (country and region), the coordinates of the sampling points (latitude and longitude in decimal degrees), the species group as defined in Figs. 2, 3 (sp group), the GMYC species identification as labeled in Figs. 2, 3 (sp) and the GMYC species number (nb) from Vuataz et al. [1] are indicated. Individuals are named only when they originated from type localities (i.e., topotypes) or could be unambiguously identified, and are otherwise referred to as “sp”. For the 11 newly collected individuals (**bold**), the GMYC species numbers are indicated when they obviously clustered with one of the 31 GMYC species from Vuataz et al. [1]. When individuals are from GMYC species linked to more than one name in Vuataz et al. [1], the latest name(s) are mentioned between brackets.

Table S4. Results of birth-death likelihood (BDL) analysis of the model-completed *Rhithrogena* data set (74 taxa), based on 1000 completed phylogenies generated with CorSiM [2, 3]. r = diversification rate (species per My), $r1$ = diversification rate before st; $r2$ = diversification rate after st; st = time of rate shift (in Mya); a = extinction fraction; x = rate change parameter; k = carrying capacity. The preferred model (Yule-2-rates) is indicated in bold.

Models	Yule	Yule-2-rates			Birth-death		DDL		DDX	
Mean AIC	-112.18	-113.21			-111.84		-111.46		-110.16	
SD	6.73	7.92			7.78		7.57		6.69	
%	33.00	62.00			6.00		0.00		0.00	
Parameters	r	$r1$	$r2$	st	r	a	r	x	r	k
Mean	0.20	0.21	0.19	0.22	0.16	0.37	0.13	-0.15	0.21	1192795
SD	0.01	0.01	0.22	0.13	0.02	0.15	0.02	0.07	0.01	358701.07
