

Supplementary Figure S3

Fig.S3. IHC staining for CD4, CD8 and CD11c in lymph nodes The sections of the LN collected at different time intervals from -1d to 23d period (1/per mouse and for 3 mice) from tumor control and treatment group mice, were stained with CD4 (panel A), CD8 (panel B) and CD11c (panel C) antibodies by IHC Kit. The results were observed in (40×10) horizon at time for -1d, 6d, 16d and 23d between tumor group and treatment group which stand for $p < 0.001$. Bar=50 μ m.
