Figure S1. Photographs, conceptual diagram, SEM and EDX images of Fe-(oxyhydr)oxide chimneys collected from Urashima site. Conceptual diagram and photographs of Fe-rich chimney structure at Urashima site are shown in (A).

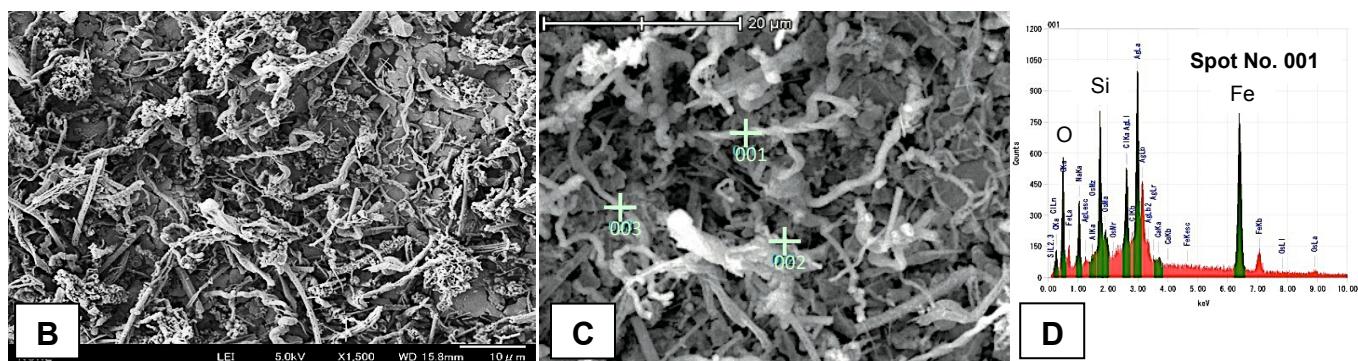

SEM images (B, C, E, F, H, I) and EDS spectrums (D, G, J) of the Fe-(oxyhydr)oxide samples collected from chimney of Urashima site are shown. Mint Green crosses indicate the EDS analysis areas in (C), (F) and (I). Only one spot (spot no. 001) data of each EDS analysis are shown in (D), (G) and (J). (B), (E) and (H) are same view. Scale bars, 10 μm . (C), (F) and (I) are same view. Scale bars, 20 μm .

Figure S2. Rarefaction curves from 16S rRNA gene clone libraries.

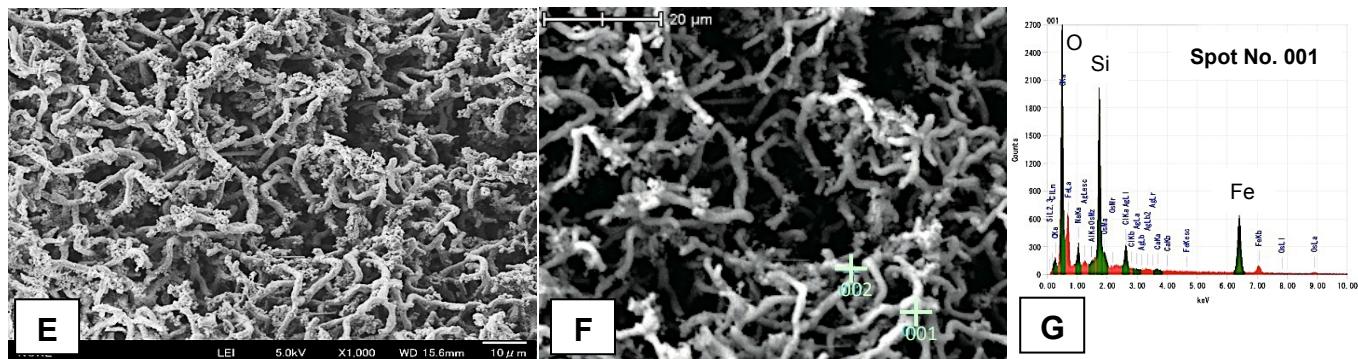

Phylotypes were defined at 97% sequence similarity. Rarefaction analysis (Heck et al., 1975 (1)) was performed using the DOTUR program (Schloss and Handelsman, 2005 (2)) to evaluate the phylotype richness of microbial communities in the iron mats.

^I Measured at 25°C

^{II} T_{max}: Maximum temperature

^{III} Gas data was collected in 2011 (NT11-18 cruise; Makita et al. (10))

^{IV} ND: No data

^V Estimated end-member composition by Lupton et al. (11), based on extrapolating to Mg concentration 43 mM. The Champagne vent fluids had pH ranging from 3.4 to 4.8. The low end of measured pH of Champagne vent fluids was consistent with CO₂ buffering in the end-member fluid.

^{VI} A detailed discussion of Snail and Urashima site can be found in Toki et al. (12).
