

Association of genetic variants in lncRNA H19 with risk of colorectal cancer in a Chinese population

Supplementary Materials

Supplementary Figure S1: Bioinformatics predictions of rs3024270, rs217727 and rs2735971 on H19 folding structure.
The folding structure alterations were demonstrated by RNAfold (A, C, E) and SNPfold (B, D, F), respectively. Arrow (Minor allele) indicates the change in structure caused by selected SNPs. Arrow a indicates the position of selected SNPs. Arrow A indicates the sequences of major allele, whereas arrow B indicates minor allele.
