

Supplementary Figure 3.

Unadsorbed residual virus in U937-pcDNA and U937-DN-IκB cells. HSV-1 titres were determined in the initial virus inoculum (I.V.I.) and in supernatants collected from cultures of both U937-pcDNA (pcDNA) and U937-DN-IκB (DN-IκB) cell transfectants infected with HSV-1 at a MOI of 50 PFU/cell, at the end of the adsorption period.
