

Supplementary Figure 1. Epithelial neutrophil populations are unaltered by topical Dexamethasone.

Neutrophils (defined as CD45^{INT}CD11b+CD16+CD14- live granulocytes) are shown as absolute numbers and percentage of leukocytes before and after the use of topical steroids (preservative free Dexamethasone 0.1%). Individuals had conjunctival OSIC before and after uncomplicated cataract surgery. Repeated samples were taken at 4 weeks post-op and in the absence of ocular surface and intra-ocular inflammation (NS: Not significant [p>0.05]).
