

Table S1. Association of TDP-43 and/or FMRP with AD and Schizophrenia

Diseases	Facts	References
Alzheimer's Disease (AD)	TDP-43 pathology is detected in 25% to 50% of AD cases.	[20]
	FMRP induces dendritic spine shrinkage and loss that contribute to AD pathogenesis in conjunction with Rac1 and CYFIP1/2.	[1]
	FMRP-target genes, e.g. App etc. are involved in AD pathogenesis and disease severity. App is one of the target mRNAs of TDP-43.	[18, 19]; Current MS (data not shown).
Schizophrenia	Schizophrenia-like symptoms are associated with patients with FTD, and TDP-43 pathology has been depicted as one of the molecular mechanisms behind the psychosis.	[7]
	FMRP pathology is present in schizophrenia patients with lower IQ and early onset of the disease phenotypes	[11]
	Expression levels of FMRP target mRNAs including Rac1, App etc. are altered in a subpopulation of schizophrenia patients with or without known <i>fmr1</i> gene mutations	[9]
