Figure S1. Phylogenetic tree derived from the Bayesian analysis of the concatenated data. Bayesian posterior probabilities and bootstrap values from likelihood analysis are provided above and below branches respectively. Bootstrap values below 50 are not shown

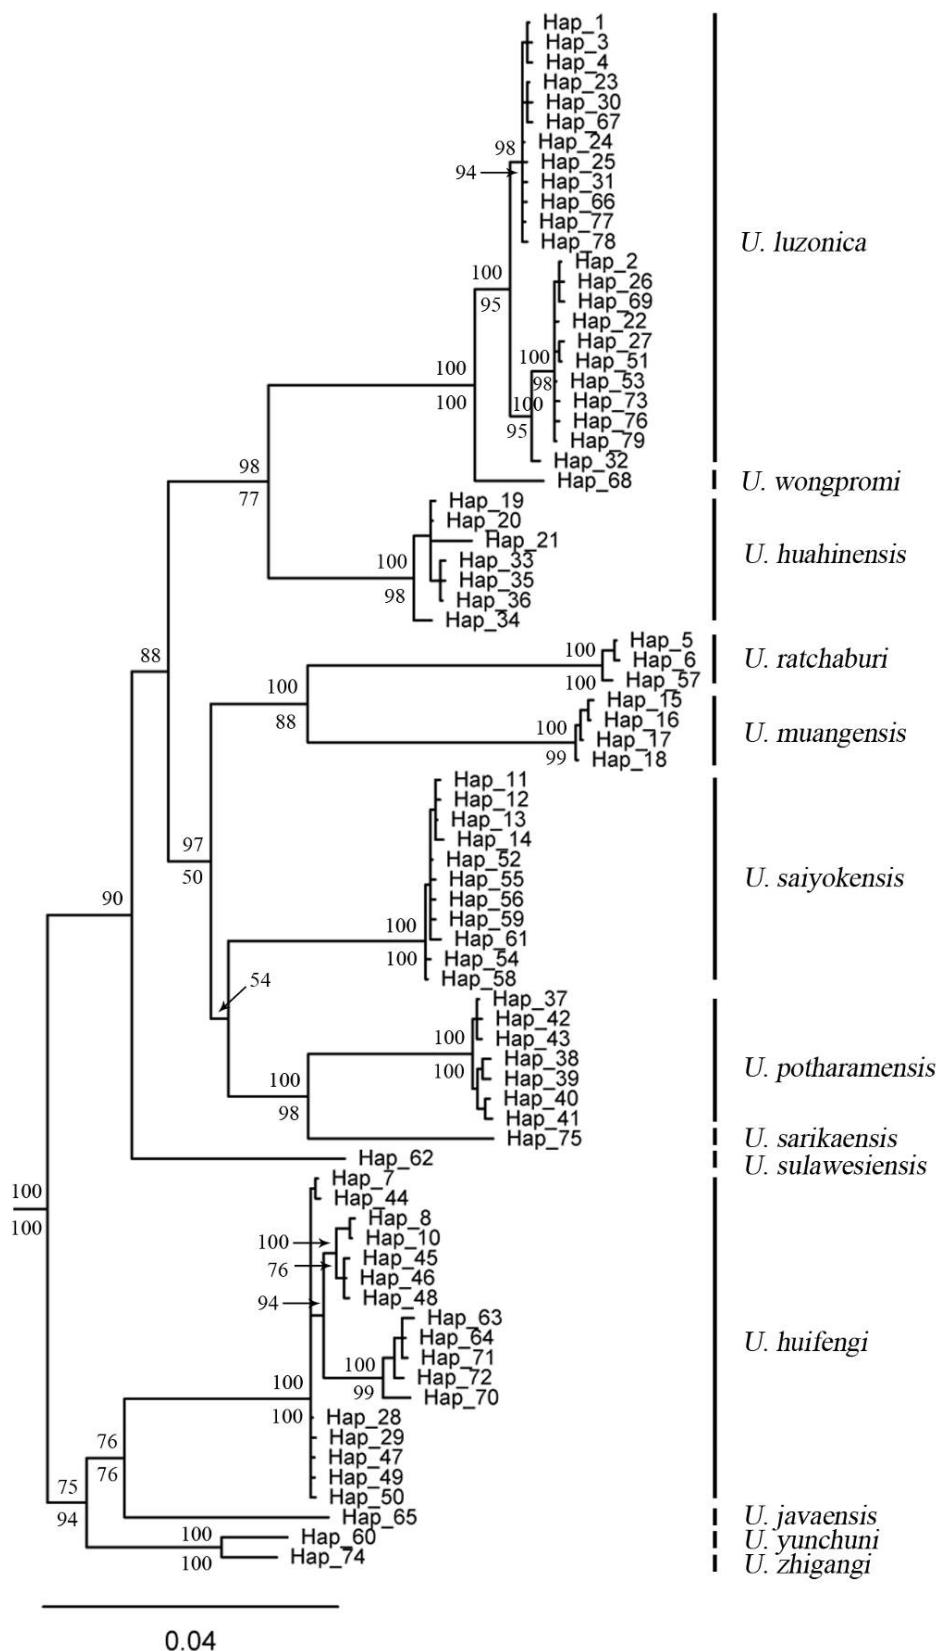

Figure S2. Individual gene trees. a, COI gene tree derived from the Bayesian analysis; b, clade *U.huifengi* of the COI gene tree derived from maximum likelihood analysis; c, 28S gene tree. Bayesian posterior probabilities and bootstrap values from the likelihood analysis are provided above and below branches respectively. Bootstrap values below 50 are not shown

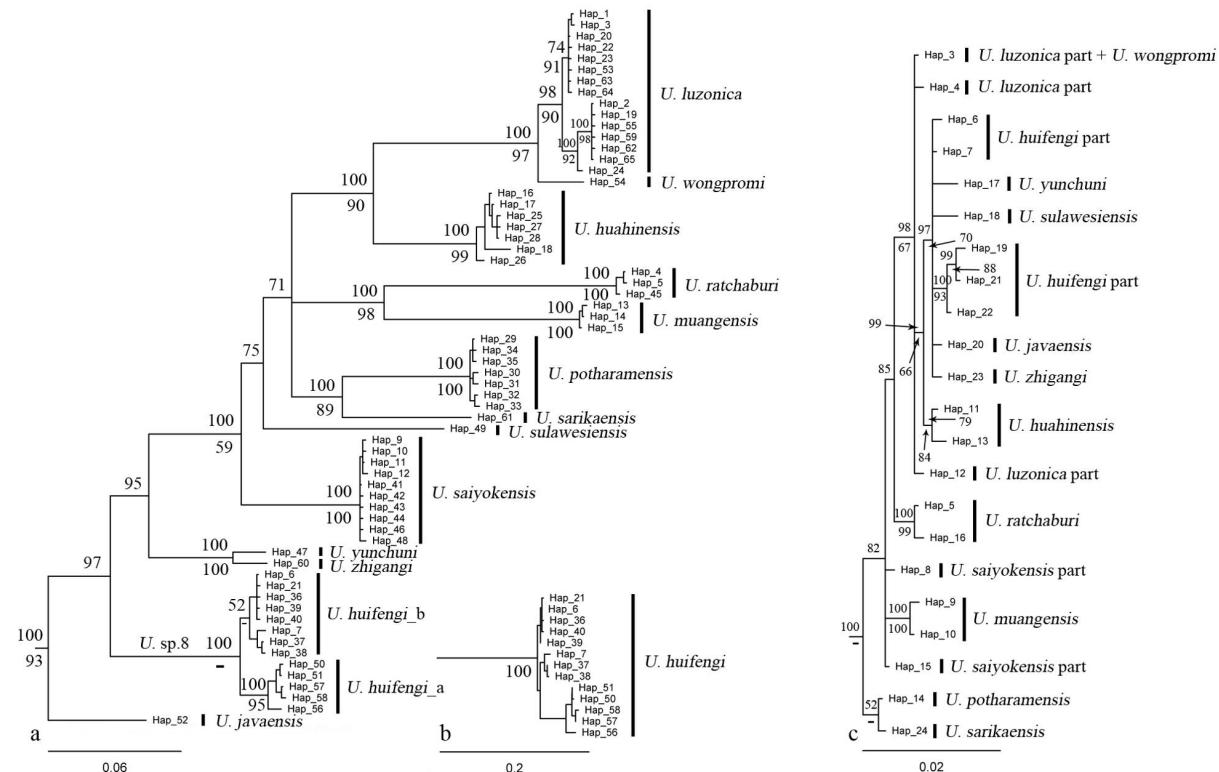

Figure S3. Results of bPTP species delimitation analysis based on COI gene tree derived from likelihood analysis (left) and Bayesian analysis (right). BS values are provided near the nodes

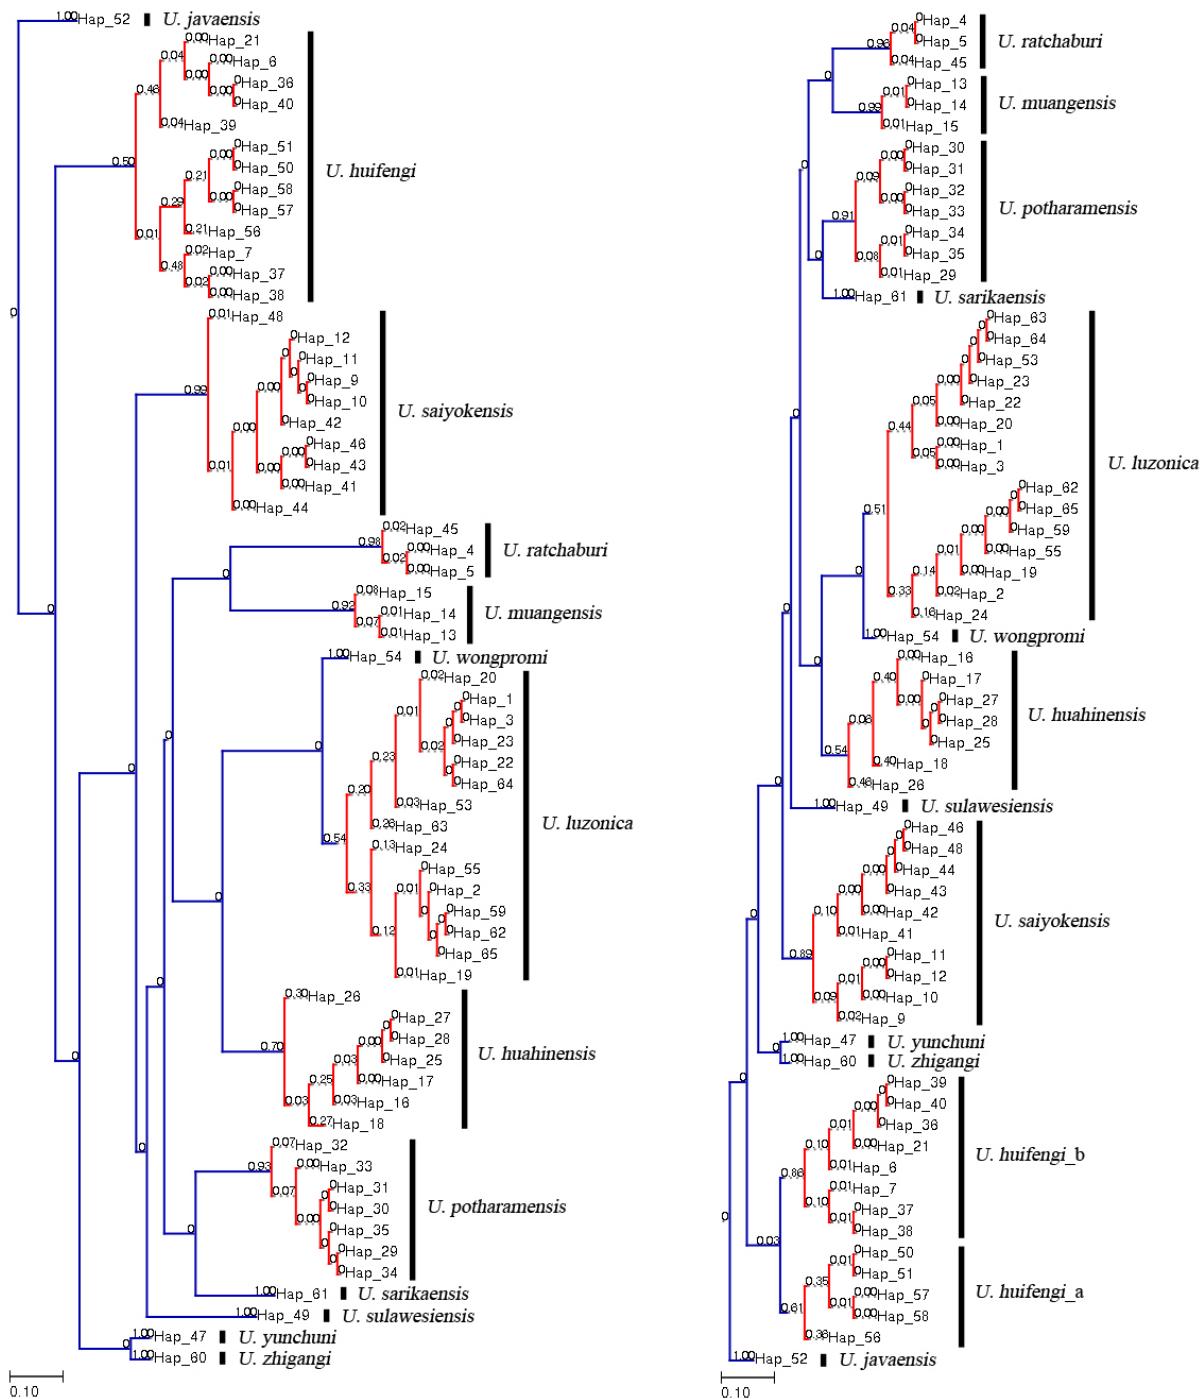

Figure S4. Results of bPTP species delimitation analysis based on 28S gene tree derived from Bayesian analysis (above) and likelihood analysis (below). BS values are provided near the nodes

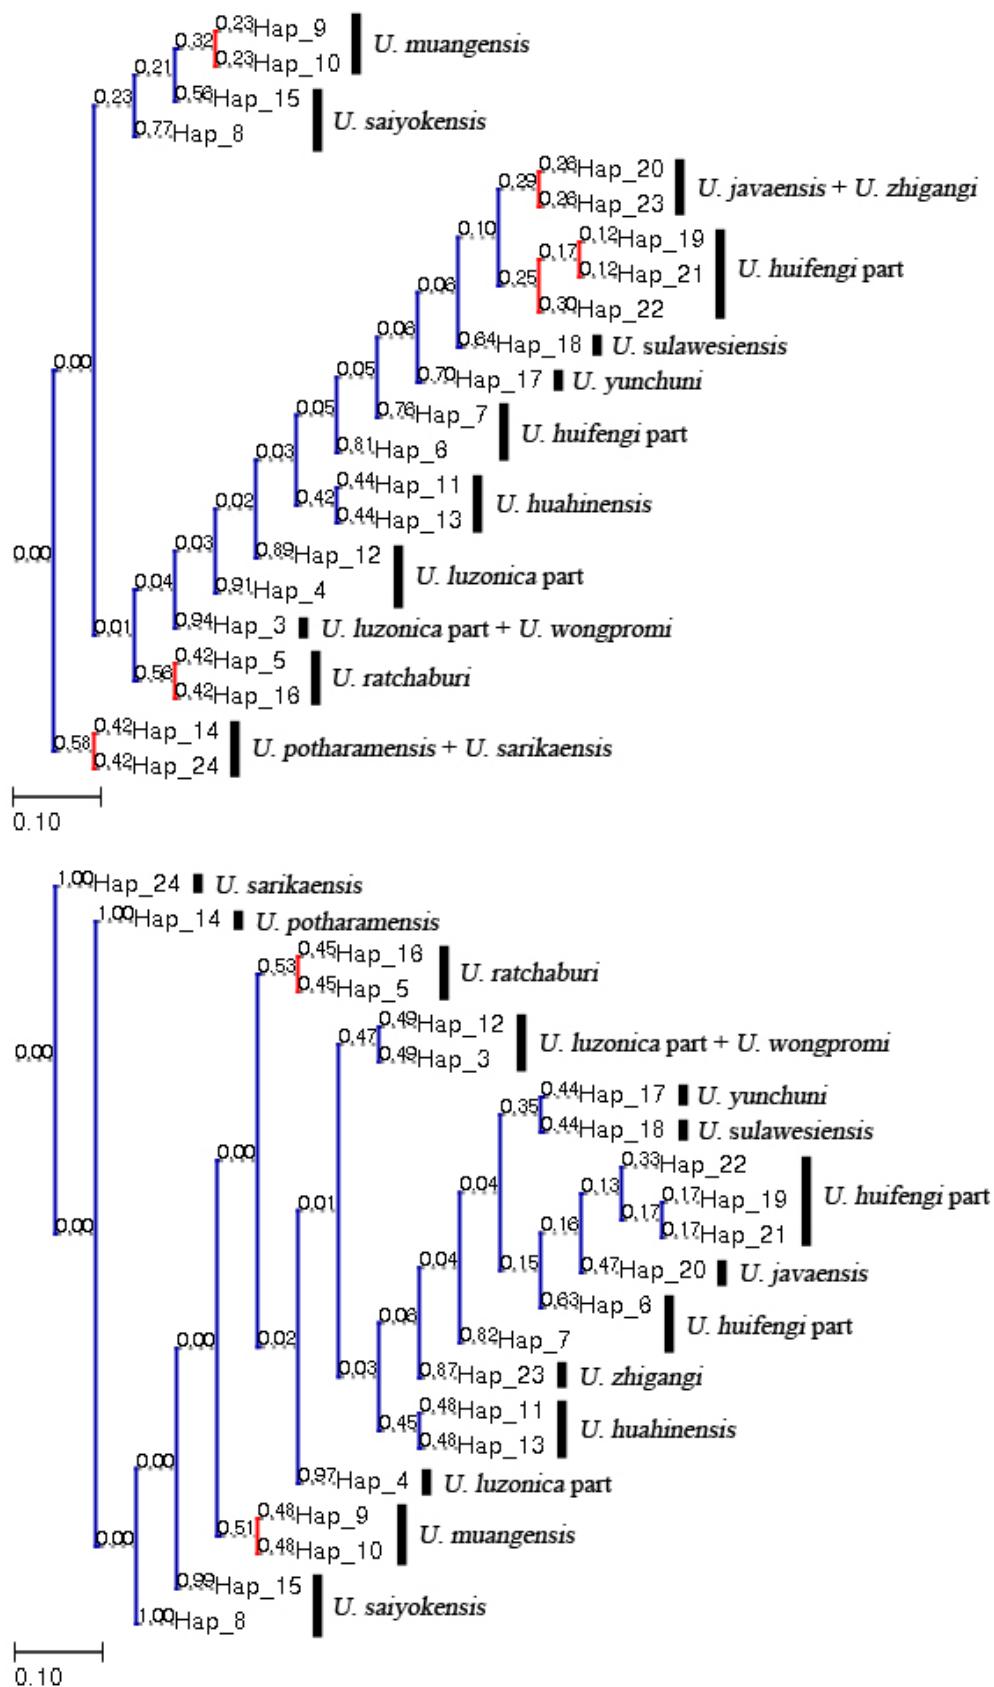

Figure S5. Results of GMYC species delimitation analysis based on COI gene tree. The blue line indicates the maximum-likelihood transition point where the branching rates switch from inter-specific to intra-specific events, as estimated by the GMYC model. Below are lineages-through-time plot (left) and single-threshold GMYC likelihood profile plot (right)

Text S1. Description of *Uthina huahinensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:3CE79C7A-9273-4E4B-8B00-FB60E7FEF0AF](https://lsid.zoobank.org/act:3CE79C7A-9273-4E4B-8B00-FB60E7FEF0AF)

Figs S6–S8

Material examined. Holotype: male, Dao Cave ($12^{\circ}35.449'N$, $99^{\circ}43.692'E$, elevation 123 m), Nong Phlap, Hua Hin District, Prachuap Kiri Khan, Thailand, 30 October 2014, H. Zhao, Y. Li and Z. Chen leg. Paratypes: one male and two females, same data as holotype.

Other material. One male, two females and seven juveniles, same data as holotype. One male, seven females and two juveniles, Laplae Cave and Kailone Cave ($12^{\circ}36.255'N$, $99^{\circ}43.341'E$, elevation 175 m), Nong Phlap, Hua Hin District, Prachuap Kiri Khan, Thailand, 30 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles *U. huifengi* sp. nov., in having similar male chelicerae (Fig. S7D), uncus (Fig. S7A), and female external genitalia (Fig. S8A), but can be distinguished by distally bifurcated appendix (Fig. S7A), by small angular apophysis close to ‘knee’ of procursus (arrow in Fig. S6D), and by different shape of vulval pore plates (anterior part wide but posterior part narrow, Fig. S8B).

Description. Male (holotype): Total length 4.09 (4.29 with clypeus), carapace 1.09 long, 1.33 wide, opisthosoma 3.00 long, 0.98 wide. Leg I: 43.15 (10.38 + 0.53 + 10.64 + 19.10 + 2.50), leg II: 26.60 (7.05 + 0.52 + 6.73 + 10.90 + 1.40), leg III: 17.32 (4.94 + 0.48 + 4.42 + 6.60 + 0.88), leg IV: 22.36 (6.86 + 0.50 + 6.03 + 8.97 + 1.13); tibia I L/d: 97. Distance PME-PME 0.32; diameter PME 0.08; distance PME-ALE 0.02; AME absent. Sternum wider than long (0.84/0.70). Habitus as in Fig. S7B. Carapace yellowish, with large brown marks extending to ocular area; ocular area yellowish; sternum brown. Legs yellowish, distal parts of femora and tibiae whitish, darker rings absent. Opisthosoma yellowish, with spots posteriorly. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S7D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S6A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procursus simple proximally but complex distally; uncus strongly curved, with scales and a thin distal transparent process; appendix hooked, bifurcated distally, with scales; embolus weakly sclerotized, with some transparent projections distally. Retrolateral trichobothrium of tibia I at 4.9%; legs with short vertical setae on metatarsi and tarsi, without spines and curved setae; tarsus I with more than 20 distinct pseudosegments.

Female: Similar to male, habitus as in Fig. S7C. Total length 4.57 (4.87 with clypeus), carapace 1.17 long, 1.20 wide, opisthosoma 3.40 long, 1.13 wide; tibia I: 10.45; tibia I L/d: 82. Distance PME-PME 0.24; diameter PME 0.09; distance PME-ALE 0.02; AME absent. Sternum wider than long (0.84/0.72). Opisthosoma without spots. Ocular area brown, without eye-stalks. External genitalia (Fig. S8A) with a weakly sclerotized knob. Vulva (Fig. S8B) with an anterior arch and two nearly semicircular pore plates.

Variation: Unknown. Leg I missing in other specimens.

Distribution. Thailand (Prachuap Kiri Khan).

Natural history. The species was found in the entrance zones of caves.

Text S2. Description of *Uthina huifengi* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:C81D62D1-EE65-421A-B4DD-3515E75D394E](https://urn.lsid.zoobank.org/act:C81D62D1-EE65-421A-B4DD-3515E75D394E)

Figs S9–S11

Material examined. Holotype: male, Kalam Cave ($0^{\circ}12.275'S$, $100^{\circ}23.475'E$, elevation 874 m), Bukittinggi, West Sumatra, Sumatra, Indonesia, 18 May 2014, Z. Yao leg. Paratypes: two males and three females, same data as holotype.

Other material. Two males and eight females, same data as holotype. Two males, two females and one juvenile, Tarang Cave ($0^{\circ}12.653'S$, $100^{\circ}24.977'E$, elevation 877 m), Bukittinggi, West Sumatra, Sumatra, Indonesia, 12 May 2014, Z. Yao leg. One male and two juveniles, near river in a village ($2^{\circ}04.834'S$, $101^{\circ}22.448'E$, elevation 1054 m), Talang Cindang, Kerinci, Jambi, Sumatra, Indonesia, 24 May 2014, Z. Yao leg. One female and two juveniles, Bukit Ponggang Cave ($0^{\circ}44.245'S$, $100^{\circ}50.330'E$, elevation 278 m), Padang Sibusuk Village, Sijunjung, West Sumatra, Sumatra, Indonesia, 27 May 2014, Z. Yao leg. One male, four females and five juveniles, Cave without a name ($0^{\circ}17.982'S$, $100^{\circ}22.090'E$, elevation 940 m), Fort de Kock, Bukittinggi, West Sumatra, Sumatra, Indonesia, 10 January 2014, H. Zhao leg. One male, three females and one juvenile, Jorong Koto Tuo Cave ($0^{\circ}14.901'S$, $100^{\circ}28.992'E$, elevation 714 m), Kab Agam Tabik Simarasok Village, West Sumatra, Sumatra, Indonesia, 11 January 2014, H. Zhao leg. Two females and three juveniles, Japanese Cave ($0^{\circ}18.458'S$, $100^{\circ}21.933'E$, elevation 906 m), Bukittinggi, West Sumatra, Sumatra, Indonesia, 11 January 2014, H. Zhao leg. One male, seven females and two juveniles, Batang Lawang Cave ($0^{\circ}15.739'S$, $100^{\circ}18.491'E$, elevation 761 m), Kanagarian Matuailia, Kab Agam Kecamatan Matur, West Sumatra, Sumatra, Indonesia, 12 January 2014, H. Zhao leg. Two females and three juveniles, Jenjang Seribu Cave ($0^{\circ}18.104'S$, $100^{\circ}21.335'E$, elevation 815 m), Bukittinggi, West Sumatra, Sumatra, Indonesia, 12 January 2014, H. Zhao leg.

Etymology. The specific name is a patronym in honor of the collector Huifeng Zhao; noun (name) in genitive case.

Diagnosis. This species resembles *U. huahinensis* sp. nov., in having similar male chelicerae (Fig. S10D), uncus (Fig. S10A), and female external genitalia (Fig. S11A), but can be distinguished by appendix not bifurcated distally (Fig. S10A), by small angular apophysis close to large weakly sclerotized apophysis of procursus (arrow in Fig. S9D), and by different shape of vulval pore plates (anterior part narrow but posterior part wide, Fig. S11B).

Description. Male (holotype): Total length 3.92 (4.00 with clypeus), carapace 1.02 long, 1.20 wide, opisthosoma 2.72 long, 0.86 wide. Leg I: 37.44 ($8.91 + 0.52 + 9.10 + 16.73 + 2.18$), leg II: 22.53 ($5.96 + 0.53 + 5.71 + 9.23 + 1.10$), leg III: 14.83 ($4.23 + 0.44 + 3.66 + 5.64 + 0.86$), leg IV missing; tibia I L/d: 84. Distance PME-PME 0.35; diameter PME 0.08; distance PME-ALE 0.033; AME absent. Sternum wider than long (0.68/0.60). Habitus as in Fig. S10B. Carapace yellowish, with large brown marks extending to ocular area; ocular area yellowish; sternum brown. Legs yellowish, subdistal parts of tibiae whitish, darker rings absent. Opisthosoma pale grey dorsally but yellowish ventrally, with spots dorsally and laterally. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S10D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S9A–B; trochanter with a short

retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; proctiger simple proximally but complex distally; uncus strongly curved, with scales; appendix hooked, with a scaly edge and a small apophysis medially; embolus weakly sclerotized, with transparent distal projections. Retrolateral trichobothrium of tibia I at 4.4%; legs with short vertical setae on metatarsi and tarsi, without spines and curved setae; tarsus I with approximately 15 distinct pseudosegments.

Female: Similar to male, habitus as in Fig. S10C. Total length 3.37 (3.84 with clypeus), carapace 1.01 long, 1.17 wide, opisthosoma 2.63 long, 0.94 wide; tibia I: 7.44; tibia I L/d: 63. Distance PME-PME 0.23; diameter PME 0.11; distance PME-ALE 0.06; AME absent. Sternum wider than long (0.80/0.71). Opisthosoma yellowish. Ocular area brown, without eye-stalks. External genitalia (Fig. S11A) with a weakly sclerotized knob. Vulva (Fig. S11B) with an anterior arch and two pore plates.

Variation: Tibia I in males (n=6): 6.79–9.10 (mean: 7.85). Tibia I in females (n=27): 5.19–7.44 (mean: 6.95).

Distribution. Indonesia (West Sumatra, Jambi).

Natural history. The species was found in the entrance zones of caves and in bamboo internodes.

Text S3. Description of *Uthina javaensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:560EF029-35C9-49CC-81BF-5D42E45CA3C4](https://doi.org/10.1544/zoobank.560EF029-35C9-49CC-81BF-5D42E45CA3C4)

Fig. S12

Material examined. Holotype: female, Gua (cave) Gajah ($7^{\circ}56.662'S$, $110^{\circ}26.404'E$, elevation 234 m), Mangunan Village, Bantul, Java, Indonesia, 27 August 2014, H. Zhao and Z. Yao leg.

Other material. One female, same data as holotype.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species can be distinguished from all other *Uthina* species by strongly protruding medially vulval anterior arch (Fig. S12B) and by unique shape of vulval pore plates (Fig. S12B).

Description. Female (holotype): Total length 4.74 (5.13 with clypeus), carapace 1.10 long, 1.23 wide, opisthosoma 3.64 long, 1.25 wide. Leg I: 34.74 (8.33 + 0.52 + 8.72 + 15.13 + 2.04), leg II: 20.75 (5.64 + 0.51 + 5.45 + 8.33 + 1.10), leg III, leg IV missing; tibia I L/d: 73. Distance PME-PME 0.22; diameter PME 0.12; distance PME-ALE 0.05; AME absent. Sternum wider than long (0.84/0.78). Habitus as in Figs S12C–E. Carapace yellowish, with brown marks extending to ocular area; ocular area brown; sternum brown. Legs yellowish, distal parts of femora brown, distal parts of tibiae whitish, subdistal parts of tibiae brown, darker rings absent. Opisthosoma yellowish, with brown spots dorsally and laterally. Ocular area elevated; without eye-stalks. Thoracic furrow absent. External genitalia (Fig. S12A) with a weakly sclerotized knob. Vulva (Fig. S12B) with an anterior arch and two pore plates. Retrolateral trichobothrium of tibia I at 4.6%; legs with short vertical setae on metatarsi and tarsi, without spines and curved setae; tarsus I with approximately 13 distinct pseudosegments.

Male: Unknown.

Variation: Unknown. Leg I missing in another female.

Distribution. Indonesia (Java).

Natural history. The species was found in the entrance zone of the cave.

Text S4. Description of *Uthina muangensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:5736AB8A-46E5-4E50-900C-0E7CE3041D87](https://lsid.zoobank.org/act:5736AB8A-46E5-4E50-900C-0E7CE3041D87)

Figs S13–S15

Material examined. Holotype: male, Sawamg Cave ($13^{\circ}28.014'N$, $99^{\circ}44.014'E$, elevation 44 m), Thuang Luang, Muang District, Ratchaburi, Thailand, 31 October 2014, H. Zhao, Y. Li and Z. Chen leg. Paratypes: two females, same data as holotype.

Other material. Three males, six females and one juvenile, same data as holotype.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles *U. saiyokensis* sp. nov., in having similar male chelicerae (Fig. S14D) and procursus (Figs S13C–D), but can be distinguished by proximal apophysis of uncus indistinct (Fig. S14A), by wide and medially strongly protruding appendix (Fig. S14A), by knob of female external genitalia not swollen distally (Fig. S15A), and by nearly elliptic vulval pore plates (Fig. S15B).

Description. Male (holotype): Total length 4.82 (5.06 with clypeus), carapace 1.30 long, 1.50 wide, opisthosoma 3.52 long, 1.30 wide. Leg I missing, leg II: 35.85 (9.17 + 0.67 + 9.23 + 15.38 + 1.40), leg III: 22.89 (6.67 + 0.60 + 5.96 + 8.72 + 0.94), leg IV: 29.73 (8.40 + 0.60 + 7.56 + 11.92 + 1.25). Distance PME-PME 0.43; diameter PME 0.11; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.95/0.80). Habitus as in Fig. S14B. Carapace yellowish, with large brown radiating marks extending to ocular area; ocular area yellowish, with brown marks; sternum dark brown. Legs yellowish, distal parts of femora and tibiae whitish, darker rings absent. Opisthosoma yellowish, with spots posteriorly. Ocular area elevated; each eye triad on top of a laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S14D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S13A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procursus simple proximally but complex distally; uncus strongly curved, with scales and a thin distal transparent process; appendix wide, strongly protruding medially, with scales; embolus weakly sclerotized, with some transparent projections distally. Legs with short vertical setae on metatarsi and tarsi, without spines and curved setae.

Female: Similar to male, habitus as in Fig. S14C. Total length 5.08 (5.31 with clypeus), carapace 1.40 long, 1.52 wide, opisthosoma 3.68 long, 1.40 wide; tibia I: 13.14; tibia I L/d: 82. Distance PME-PME 0.29; diameter PME 0.12; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.98/0.83). Opisthosoma without spots. Ocular area without eye-stalks. External genitalia (Fig. S15A) with a weakly sclerotized knob. Vulva (Fig. S15B) with an anterior arch and two nearly elliptic pore plates.

Variation: Unknown. Leg I missing in other specimens.

Distribution. Thailand (Ratchaburi).

Natural history. The species was found in the entrance zone of the cave.

Text S5. Description of *Uthina potharamensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:4A034FDA-E209-4534-9881-99C4A22EB961](https://doi.org/10.15462/zoobank.4A034FDA-E209-4534-9881-99C4A22EB961)

Figs S16–S18

Material examined. Holotype: male, Tham (cave) Nam ($13^{\circ}41.860'N$, $99^{\circ}45.415'E$), Nang Kaeo, Potharam District, Ratchaburi, Thailand, 21 October 2014, H. Zhao, Y. Li and Z. Chen leg. Paratypes: two females, same data as holotype.

Other material. One male, four females and five juveniles, same data as holotype.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles *U. ratchaburi* Huber, 2011, in having similar male chelicerae (Fig. S17D), uncus (Fig. S17A), and appendix (Fig. S17A), but can be distinguished by presence of a membranous lamella proximally on large, weakly sclerotized prolateral apophysis of procturus (arrow in Fig. S16D), by knob of female external genitalia not bifurcated (Fig. S18A), and by long distance between two vulval pore plates (Fig. S18B).

Description. Male (holotype): Total length 3.72 (3.88 with clypeus), prosoma 1.06 long, 1.22 wide, opisthosoma 2.66 long, 0.80 wide. Leg I: 43.79 ($10.58 + 0.71 + 10.64 + 19.42 + 2.44$), leg II: 25.16 ($6.41 + 0.53 + 6.54 + 10.51 + 1.17$), leg III: 16.76 ($4.74 + 0.50 + 4.17 + 6.41 + 0.94$), leg IV: 22.16 ($6.41 + 0.50 + 5.51 + 8.65 + 1.09$). Distance PME-PME 0.22; diameter PME 0.10; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.75/0.70). Habitus as in Fig. S17B. Carapace yellowish, with light brown marks extending to ocular area; ocular area yellowish, with light brown marks; sternum brown. Legs yellowish, darker rings absent. Opisthosoma yellowish, with spots dorsally. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S17D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S16A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procturus simple proximally but complex distally; uncus strongly curved, with scales and a thin distal transparent process; appendix hooked and with scales; embolus weakly sclerotized. Legs with short vertical setae on tibiae, metatarsi and tarsi; without spines and curved setae.

Female: Similar to male, habitus as in Fig. S17C. Total length 4.37 (4.68 with clypeus), carapace 1.17 long, 1.22 wide, opisthosoma 3.20 long, 1.02 wide; tibia I: 11.09; tibia I L/d: 84. Distance PME-PME 0.24; diameter PME 0.10; distance PME-ALE 0.03. Sternum wider than long (0.95/0.75). Carapace and ocular area with dark brown marks; ocular area without eye-stalks. External genitalia (Fig. S18A) with a weakly sclerotized knob. Vulva (Fig. S18B) with an anterior arch and two elliptic pore plates.

Variation: Leg I missing in another male. Tibia I in females (n=4): 9.29–11.12 (mean: 10.21).

Distribution. Thailand (Ratchaburi).

Natural history. The species was found in the entrance zone of the cave.

Text S6. Description of *Uthina saiyokensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:0780BF58-5336-4F81-8D2E-9DDDEE3CA7A6](https://doi.org/10.15462/zoobank.0780BF58-5336-4F81-8D2E-9DDDEE3CA7A6)

Figs S19–S21

Material examined. Holotype: male, Cave without a name ($14^{\circ}11.400'N$, $99^{\circ}01.555'E$, elevation 334 m), Wang Krachae, Sai Yok District, Kanchanaburi, Thailand, 2 November 2014, H. Zhao, Y. Li and Z. Chen leg. Paratype: one female, same data as holotype.

Other material. Two males, two females and one juvenile, same data as holotype. One male and nine females, Cave without a name ($14^{\circ}11.429'N$, $99^{\circ}01.594'E$, elevation 324 m), Wang Krachae, Sai Yok District, Kanchanaburi, Thailand, 2 November 2014, H. Zhao, Y. Li and Z. Chen leg. Two females and three juveniles, Cave without a name ($14^{\circ}12.219'N$, $99^{\circ}01.666'E$, elevation 325 m), Wang Krachae, Sai Yok District, Kanchanaburi, Thailand, 1 November 2014, H. Zhao, Y. Li and Z. Chen leg. One female and four juveniles, Cave without a name ($14^{\circ}12.127'N$, $99^{\circ}01.195'E$, elevation 438 m), Wang Krachae, Sai Yok District, Kanchanaburi, Thailand, 1 November 2014, H. Zhao, Y. Li and Z. Chen leg. Three juveniles, Cave without a name ($14^{\circ}12.182'N$, $99^{\circ}01.416'E$, elevation 342 m), Wang Krachae, Sai Yok District, Kanchanaburi, Thailand, 1 November 2014, H. Zhao, Y. Li and Z. Chen leg.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles *U. muangensis* sp. nov., in having similar male chelicerae (Fig. S20D) and procursus (Figs S19C–D), but can be distinguished by presence of a distinct apophysis proximally on uncus (arrow in Fig. S20A), by slender appendix and appendix not protruding medially (Fig. S20A), by knob of female external genitalia swollen distally (Fig. S21A), and by nearly triangular vulval pore plates (Fig. S21B). This species also resembles *U. sarikaensis* sp. nov., in having similar knob of female external genitalia (Fig. S21A), but can be distinguished by nearly triangular vulval pore plates (Fig. S21B).

Description. Male (holotype): Total length Total length 4.57 (4.94 with clypeus), carapace 1.21 long, 1.41 wide, opisthosoma 3.36 long, 1.22 wide. Leg I: 51.1 (11.86 + 0.76 + 12.63 + 23.33 + 2.52), leg II, leg III and leg IV missing; tibia I L/d: 94. Distance PME-PME 0.37; diameter PME 0.11; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.90/0.76). Habitus as in Fig. S20B. Carapace yellowish, with large brown marks extending to ocular area; ocular area yellowish, with a brown band medially; sternum dark brown. Legs yellowish, distal parts of femora and tibiae whitish, darker rings absent. Opisthosoma yellowish, with spots dorsally. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S20D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S19A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procursus simple proximally but complex distally; uncus strongly curved, with scales; appendix hooked, with scales; embolus weakly sclerotized, with some transparent projections distally. Retrolateral trichobothrium of tibia I at 7.3%; legs with short vertical setae on metatarsi and tarsi, without spines and curved setae; tarsus I with about 5 distinct pseudosegments.

Female: Similar to male, habitus as in Fig. S20C. Total length 4.53 (4.81 with clypeus), carapace 1.13 long, 1.19 wide, opisthosoma 3.40 long, 1.41 wide. Distance PME-PME 0.25; diameter PME 0.10; distance PME-ALE 0.02; AME absent. Sternum wider than long (0.86/0.74). Opisthosoma without spots. Ocular area brown, with a dark brown band medially, without eye-stalks. External genitalia (Fig. S21A) with a weakly sclerotized knob. Vulva (Fig. S21B) with an anterior arch and two nearly triangular pore plates.

Variation: Tibia I in males (n=2): 10.58, 12.63. Tibia I in females (n=18): 7.05–11.54 (mean: 9.65).

Distribution. Thailand (Kanchanaburi).

Natural history. The species was found in the entrance zones of caves.

Text S7. Description of *Uthina sarikaensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:B74F0176-11F0-4F91-AE1F-FD5F52A834DC](https://urn.lsid.zoobank.org/act:B74F0176-11F0-4F91-AE1F-FD5F52A834DC)

Fig. S22

Material examined. Holotype: female, Tham (Cave) Sarika ($13^{\circ}29.773'N$, $99^{\circ}44.229'E$, elevation 48 m), Muang District, Ratchaburi, Thailand, 21 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles *U. potharamensis* sp. nov. and *U. saiyokensis* sp. nov., in having similar knob of female external genitalia (Fig. S22A), but can be distinguished from *U. potharamensis* sp. nov. by short distance between two vulval pore plates (Fig. S22B), distinguished from *U. saiyokensis* sp. nov. by nearly oval vulval pore plates (Fig. S22B).

Description. Female (holotype): Total length 4.03 (4.23 with clypeus), carapace 1.09 long, 1.17 wide, opisthosoma 2.94 long, 0.92 wide. Leg I, leg III and leg IV missing, leg II: 21.78 ($4.81 + 0.48 + 4.17 + 6.15 + 0.94$). Distance PME-PME 0.29; diameter PME 0.06; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.79/0.71). Habitus as in Figs S22C–E. Carapace yellowish, with brown marks extending to ocular area; ocular area yellowish, with a brown band medially and brown marks laterally; sternum brown. Legs yellowish, distal parts of femora whitish, darker rings absent. Opisthosoma yellowish, with spots posteriorly. Ocular area elevated; without eye-stalks. Thoracic furrow absent. External genitalia (Fig. S22A) with a weakly sclerotized knob. Vulva (Fig. S22B) with an anterior arch and two nearly oval pore plates. Legs with short vertical setae on metatarsi and tarsi, without spines and curved setae.

Male: Unknown.

Variation: Unknown.

Distribution. Thailand (Ratchaburi).

Natural history. The species was found in the entrance zone of the cave.

Text S8. Description of *Uthina sulawesiensis* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:4458BB80-B637-4E9D-924E-B02BD4AD5BB3](https://urn.lsid.zoobank.org/act:4458BB80-B637-4E9D-924E-B02BD4AD5BB3)

Figs S23–S25

Material examined. Holotype: male, Cave without a name ($4^{\circ}52.344'S$, $119^{\circ}53.858'E$, elevation 417 m), Maros, South Sulawesi, Indonesia, 23 August 2014, H. Zhao and Z. Yao leg. Paratype: one female, same data as holotype.

Other material. One female, Gua (cave) Liang Gosse ($4^{\circ}56.304'S$, $119^{\circ}50.341'E$, elevation 355 m), Benteng Orchard, Cenrana Village, Maros, South Sulawesi, Indonesia, 23

August 2014, H. Zhao and Z. Yao leg.

Etymology. The specific name refers to the type locality; adjective.

Diagnosis. This species resembles one type of *U. luzonica* from North Sulawesi in Huber (2011), in having similar uncus (Fig. S24A) and female external genitalia (Fig. S25A), but can be distinguished by appendix not bifurcated distally (Fig. S24A) and by large, wide vulval pore plates (Fig. S25B). This species can be distinguished from other species in *Uthina* by presence of a large membranous process distally on uncus (Fig. S24A), by presence of a large angular apophysis close to large weakly sclerotized apophysis of procursus (arrow in Fig. S23D), and by unique shape of vulval pore plates (Fig. S25B).

Description. Male (holotype): Total length 4.16 (4.42 with clypeus), carapace 1.03 long, 1.09 wide, opisthosoma 3.13 long, 0.88 wide. Leg I missing, leg II: 21.78 (5.78 + 0.47 + 5.51 + 8.72 + 1.30), leg III: 14.26 (4.10 + 0.43 + 3.53 + 5.26 + 0.94), leg IV: 20.61 (6.09 + 0.44 + 5.13 + 8.01 + 0.94). Distance PME-PME 0.27; diameter PME 0.08; distance PME-ALE 0.08; AME absent. Sternum wider than long (0.77/0.70). Habitus as in Fig. S24B. Carapace yellowish, with brown marks extending to ocular area; ocular area brown; sternum brown. Legs yellowish, distal parts of femora and tibiae whitish, subdistal parts of femora and tibiae brown, darker rings absent. Opisthosoma yellowish, with spots dorsally. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S24D, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S23A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procursus simple proximally but complex distally; uncus strongly curved, with scales, a larger transparent process distally, and a small, thin process distally; appendix hooked, with scales; embolus weakly sclerotized. Legs with short vertical setae on tibiae, metatarsi and tarsi; without spines and curved setae.

Female: Similar to male, habitus as in Fig. S24C. Total length 3.38 (3.56 with clypeus), carapace 1.00 long, 1.08 wide, opisthosoma 2.38 long, 0.96 wide; leg I missing. Distance PME-PME 0.20; diameter PME 0.11; distance PME-ALE 0.04. Sternum wider than long (0.69/0.67). Ocular area without eye-stalks. External genitalia (Fig. S25A) with a weakly sclerotized knob. Vulva (Fig. S25B) with an anterior arch and two pore plates.

Variation: Tibia I in another female: 8.46.

Distribution. Indonesia (South Sulawesi).

Natural history. The species was found in the entrance zones of caves.

Text S9. Description of *Uthina wongpromi* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:C8BDC3F2-20D7-49E6-A700-4A1E5390015D](http://urn.lsid:zoobank.org:act:C8BDC3F2-20D7-49E6-A700-4A1E5390015D)

Figs S26–S27

Material examined. Holotype: male, Phra Kha Yang Cave ($10^{\circ}19.568'N$, $98^{\circ}45.908'E$, elevation 6 m), Kraburi District, Ranong, Thailand, 28 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Other material. One juvenile, Tham Than La Cave ($16^{\circ}54.816'N$, $100^{\circ}43.227'E$, elevation 510 m), Ban Kaset Sut Village, Nakhonratchasima District, Phitsanulok, Thailand, 17 October 2014, W. Prasit, Y. Li and Z. Chen leg. Two juveniles, Taraswan Cave ($16^{\circ}55.220'N$,

100°43.19'E, elevation 460 m), Ban Tham Phrik Village, Nakhothai District, Phitsanulok, Thailand, 18 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Etymology. The specific name is a patronym in honor of the collector Wongprom Prasit; noun (name) in genitive case.

Diagnosis. This species resembles true *U. luzonica* and one type of *U. luzonica* from Fiji in Huber (2011), in having similar uncus (Fig. S27A), but can be distinguished by distally bifurcated appendix (Fig. S27A); also distinguished from true *U. luzonica* by large bifurcated apophysis close to large weakly sclerotized apophysis of procursus (arrow in Fig. S26D; large angular apophysis not bifurcated in *U. luzonica*).

Description. Male (holotype): Total length 4.30 (4.49 with clypeus), carapace 1.02 long, 1.19 wide, opisthosoma 3.28 long, 1.06 wide. Leg I: 37.12 (8.85 + 0.56 + 9.29 + 16.22 + 2.20), leg II, leg III, leg IV missing; tibia I L/d: 68. Distance PME-PME 0.32; diameter PME 0.13; distance PME-ALE 0.05; AME absent. Sternum wider than long (0.85/0.80). Habitus as in Fig. S27B. Carapace yellowish, with brown marks extending to ocular area, ocular area dark brown; sternum dark brown. Legs yellowish, distal parts of femora and tibiae whitish, darker rings absent. Opisthosoma yellowish, with spots dorsally and laterally. Ocular area elevated; each eye triad on top of a short, laterally directed eye-stalk. Thoracic furrow absent. Chelicerae as in Fig. S27C, with a pair of proximo-lateral apophyses and a pair of distal apophyses. Pedipalps as in Figs S26A–B; trochanter with a short retrolatero-ventral apophysis; femur with a dorsal apophysis proximally; procursus simple proximally but complex distally; uncus strongly curved, with scales and a thin distal transparent process; appendix hooked, with scales, bifurcated distally; embolus weakly sclerotized. Retrolateral trichobothrium of tibia I at 3.4%; legs with short vertical setae on tibiae, metatarsi and tarsi; without spines and curved setae; tarsus I with approximately 12 distinct pseudosegments.

Female: Unknown.

Variation: Unknown.

Distribution. Thailand (Ranong, Phitsanulok).

Natural history. The species was found in the entrance zones of caves.

Text S10. Description of *Uthina yunchuni* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:D94F2B1F-B4A1-4C12-868C-EBF3DE8BB683](https://urn.lsid.zoobank.org/act:D94F2B1F-B4A1-4C12-868C-EBF3DE8BB683)

Fig. S28

Material examined. Holotype: female, Cave without a name (8°05.122'N, 98°51.223'E, elevation 442 m), Ban Chong Plee, Muang District, Krabi, Thailand, 25 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Other material. One female, same data as holotype.

Etymology. The specific name is a patronym in honor of the collector Yunchun Li; noun (name) in genitive case.

Diagnosis. This species resembles *P. zhigangi* sp. nov., in having similar vulval pore plates (Fig. S28B), but can be distinguished by wide knob of female external genitalia (Fig. S28A).

Description. Female (holotype): Total length 3.63 (3.88 with clypeus), carapace 1.00

long, 1.04 wide, opisthosoma 2.63 long, 0.80 wide. Leg I missing, leg II: 20.06 ($5.45 + 0.44 + 5.13 + 7.82 + 1.22$), leg III: 13.80 ($3.97 + 0.44 + 3.53 + 5.00 + 0.86$), leg IV: 19.46 ($6.09 + 0.44 + 5.45 + 6.60 + 0.88$). Distance PME-PME 0.25; diameter PME 0.08; distance PME-ALE 0.02; AME absent. Sternum wider than long (0.70/0.62). Habitus as in Figs S28C–E. Carapace yellowish, with brown marks extending to ocular area; ocular area yellowish, with brown marks; sternum brown. Legs yellowish, distal parts of femora and tibiae whitish, darker rings absent. Opisthosoma yellowish, with spots dorsally and laterally. Ocular area elevated; without eye-stalks. Thoracic furrow absent. External genitalia (Fig. S28A) with a weakly sclerotized knob. Vulva (Fig. S28B) with an anterior arch and two long pore plates. Legs with short vertical setae on metatarsi and tarsi, without spines and curved setae.

Male: Unknown.

Variation: Tibia I in another female: 8.97.

Distribution. Thailand (Krabi).

Natural history. The species was found in the entrance zone of the cave.

Text S11. Description of *Uthina zhigangi* Yao & Li sp. nov.

[urn:lsid:zoobank.org:act:809004F3-A47B-45B5-BD93-59B0655D5E28](https://doi.org/10.1546/zoobank.809004F3-A47B-45B5-BD93-59B0655D5E28)

Fig. S29

Material examined. Holotype: female, Cave without a name ($8^{\circ}08.155'N$, $98^{\circ}48.430'E$, elevation 89 m), Ban Khao Klom Nong Thale, Muang District, Krabi, Thailand, 26 October 2014, H. Zhao, Y. Li and Z. Chen leg.

Etymology. The specific name is a patronym in honor of the collector Zhigang Chen; noun (name) in genitive case.

Diagnosis. This species resembles *P. yunchuni* sp. nov., in having similar vulval pore plates (Fig. S29B), but can be distinguished by distally narrow knob of female external genitalia (Fig. S29A).

Description. Female (holotype): Total length 4.03 (4.36 with clypeus), carapace 1.03 long, 1.10 wide, opisthosoma 3.00 long, 0.92 wide. Leg I, leg II and leg IV missing, leg III: 14.26 ($3.97 + 0.36 + 3.46 + 5.13 + 0.94$). Distance PME-PME 0.13; diameter PME 0.09; distance PME-ALE 0.03; AME absent. Sternum wider than long (0.73/0.64). Habitus as in Figs S29C–E. Carapace yellowish, with brown marks extending to ocular area; ocular area yellowish with brown marks; sternum brown. Legs yellowish, distal parts of femora whitish, darker rings absent. Opisthosoma yellowish, with spots dorsally and laterally. Ocular area elevated; without eye-stalks. Thoracic furrow absent. External genitalia (Fig. S29A) with a weakly sclerotized knob. Vulva (Fig. S29B) with an anterior arch and two long pore plates. Legs with short vertical setae on metatarsi and tarsi, without spines and curved setae.

Male: Unknown.

Variation: Unknown.

Distribution. Thailand (Krabi).

Natural history. The species was found in the entrance zone of the cave.
