

S3 Table. Vein characters of *Oryza* species.

Veins (V) are counted at 1 mm lateral space at both the left and right side of the leaf, taking 10 leaves per species ($N = 20$). Vein related anatomical parameters are quantified by examining at least three leaf transverse sections per leaf. Values are presented as average \pm SD. All the traits show significant ($P < 0.0001$) difference in wild rice. Considering the consistent oval structure of veins in all the species, only the lateral diameter or the vein, i.e., vein width is included for ANOVA.

Genome	<i>Oryza</i> species	IRGC accession number	Vein density (VD***, count)	Inter-veinal distance (IVD***, μm)	Inter-veinal mesophyll tissue length (TML = IVD X MCN, μm)		
					Vein width (VW***, μm)	Vein height (VH, μm)	
KKLL	<i>O. coarctata</i>	104502	5 \pm 0.4 (efg)	226.2 \pm 7.4 (cd)	85.08 \pm 1.86	36.50 \pm 4.3 (bc)	42 \pm 3.45

*** Represents significant difference among the species for the trait at $P < 0.001$. Different letters suggest

$N = 30$ ($N = 20$ for VD) significant differences.
