

## Unveiling MYCN regulatory networks in neuroblastoma via integrative analysis of heterogeneous genomics data

### Supplementary Materials

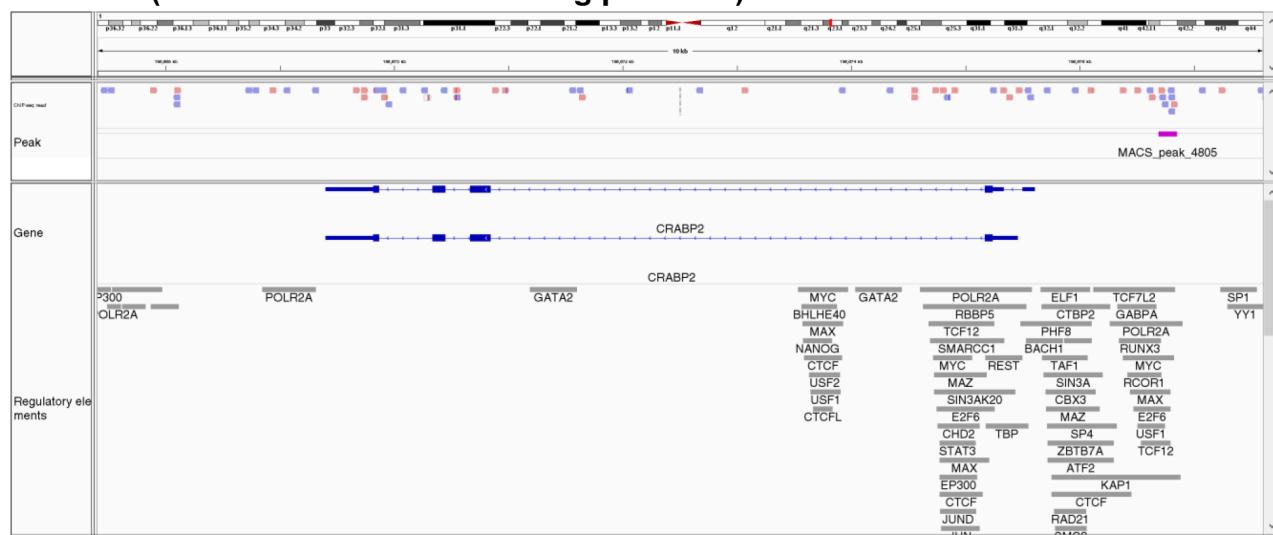

**Supplementary Figure S1: The comparison of MYCN binding sites identified by our ChIP-seq data and Murphy's study.** Murphy *et al.* performed anti-MYCN ChIP-chip experiments to identify the MYCN binding sites in Kelly, SK-N-AS, and TET21N neuroblastoma cell lines, and 256 common binding sites were identified [1]. Since the resolution of ChIP-seq and ChIP-chip are different, if the binding sites fell in a specific distance, we considered these binding sites were the same. With various distance values, the proportions of 256 sites overlapped by our datasets were calculated.

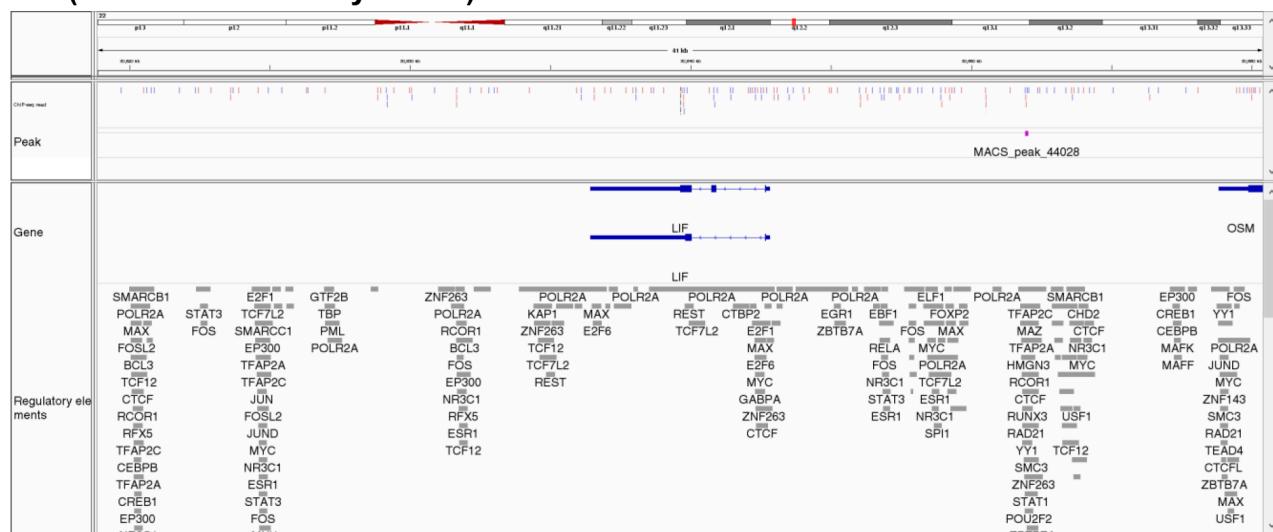

## NME2 (NME/NM23 nucleoside diphosphate kinase 2)

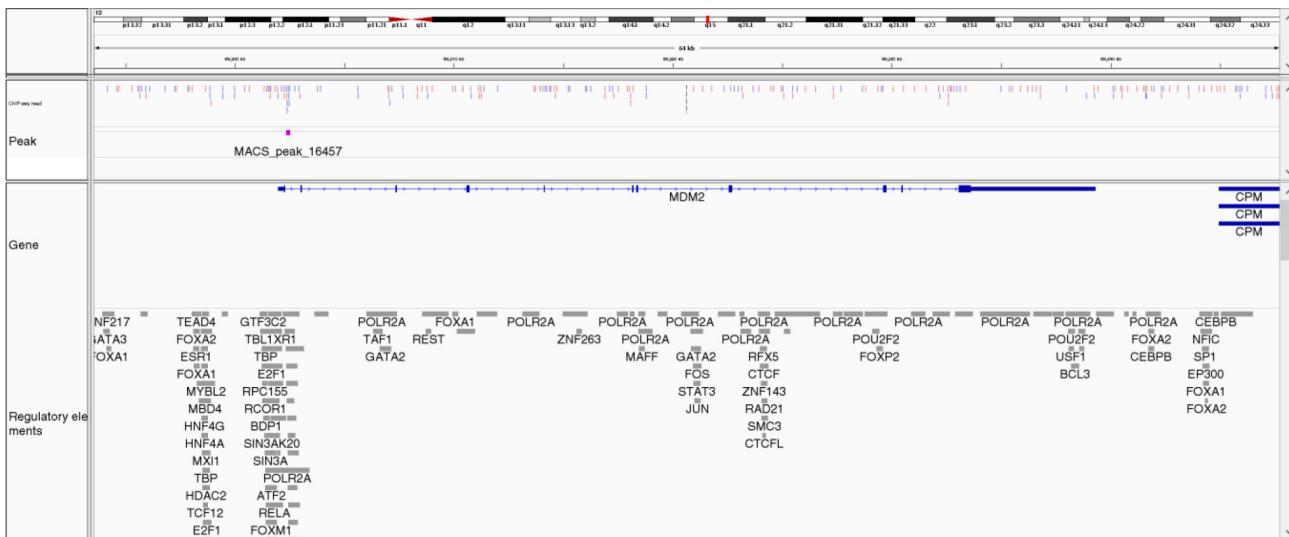

## CRABP2 (cellular retinoic acid binding protein 2)

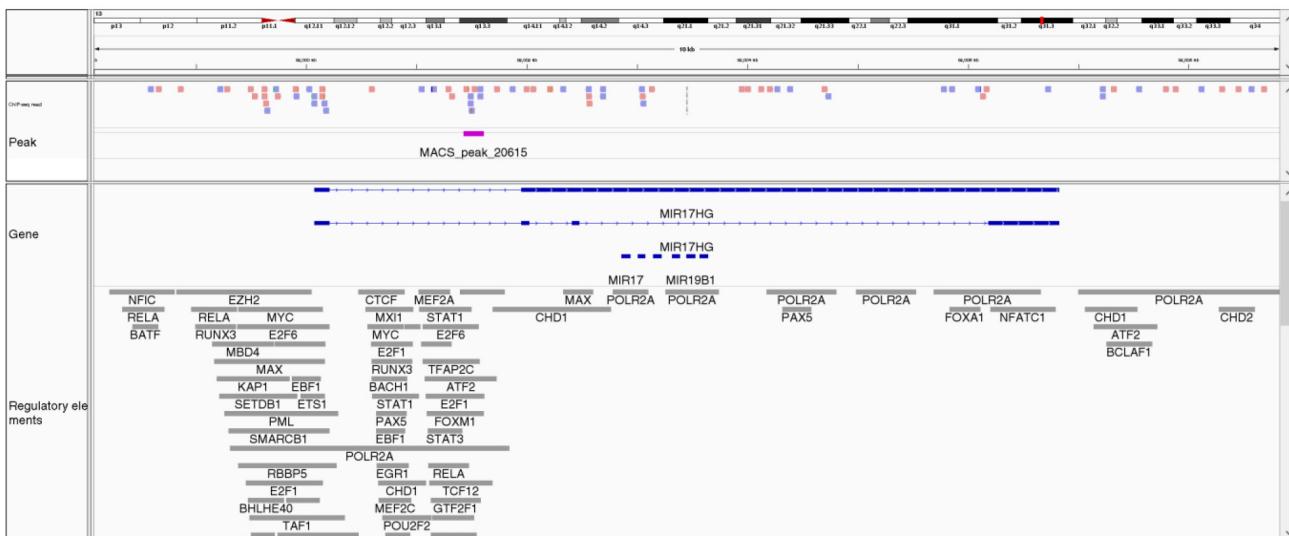

## LIF (leukemia inhibitory factor)

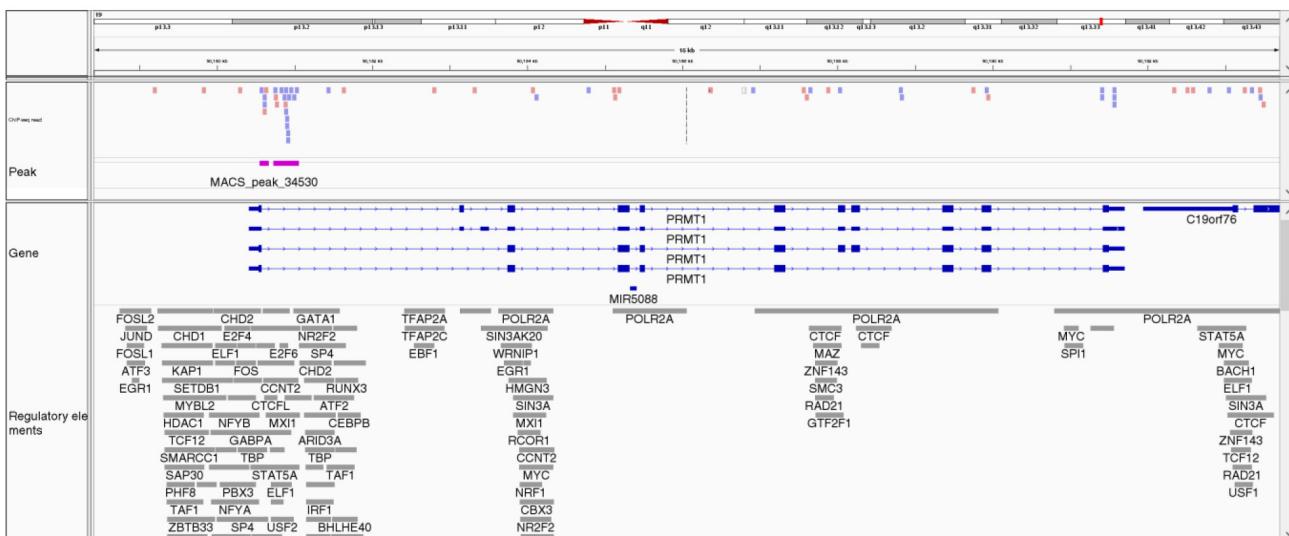

## MDM2 (MDM2 proto-oncogene, E3 ubiquitin protein ligase)

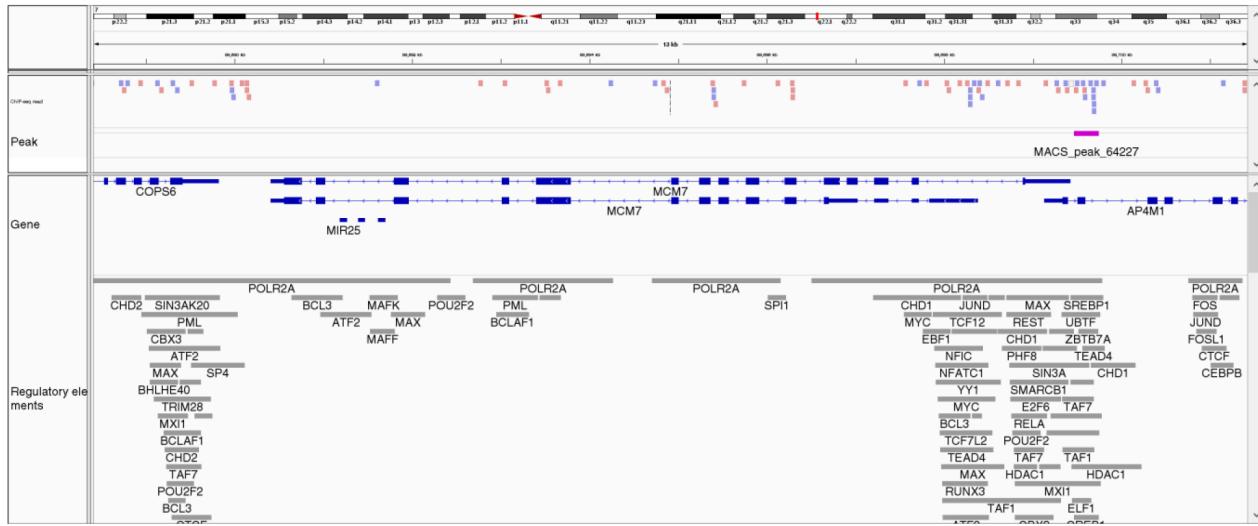

## MIR17HG (miR-17-92 cluster host gene)

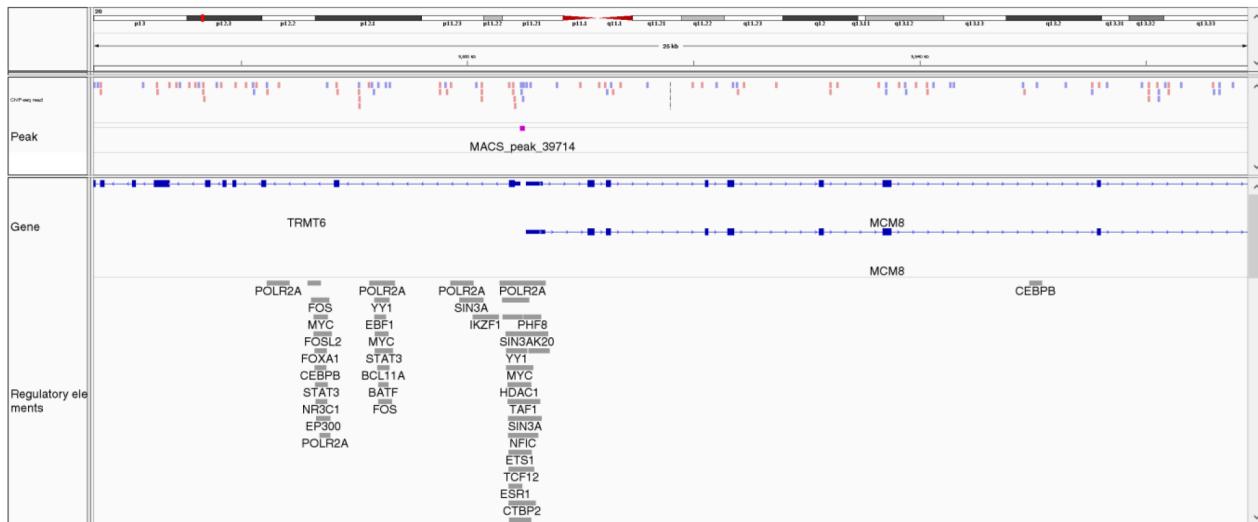

## **PRMT1 (protein arginine methyltransferase 1)**

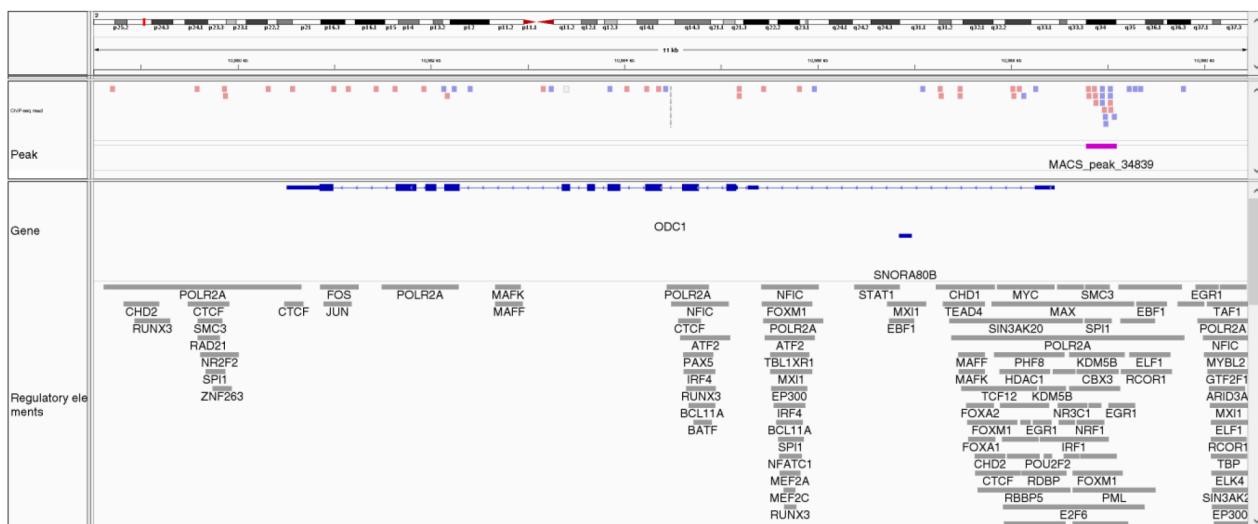

## MCM7 (minichromosome maintenance complex component 7)

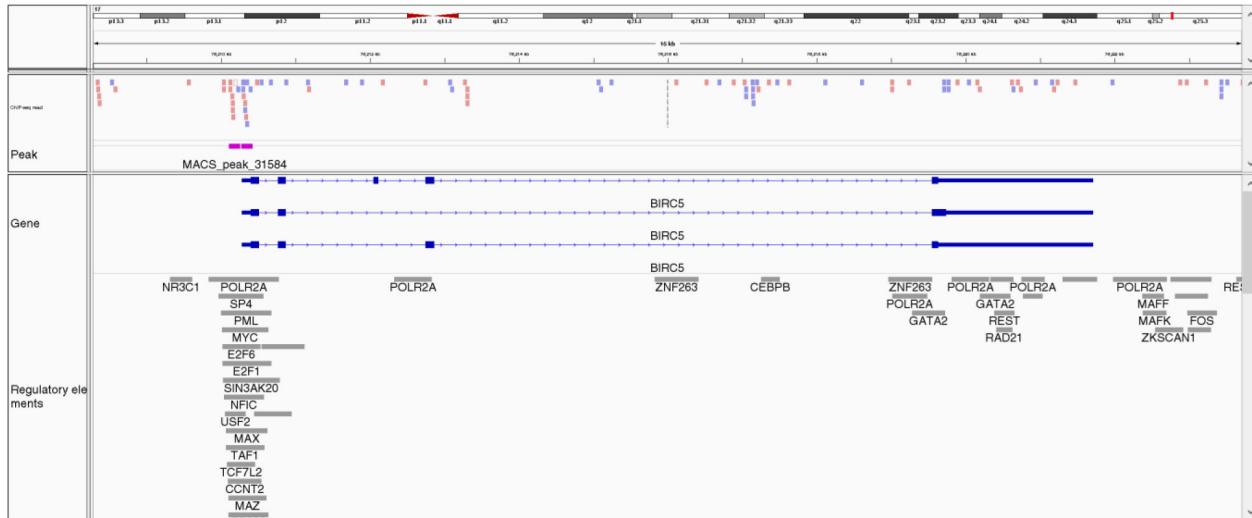

## MCM8 (minichromosome maintenance complex component 8)

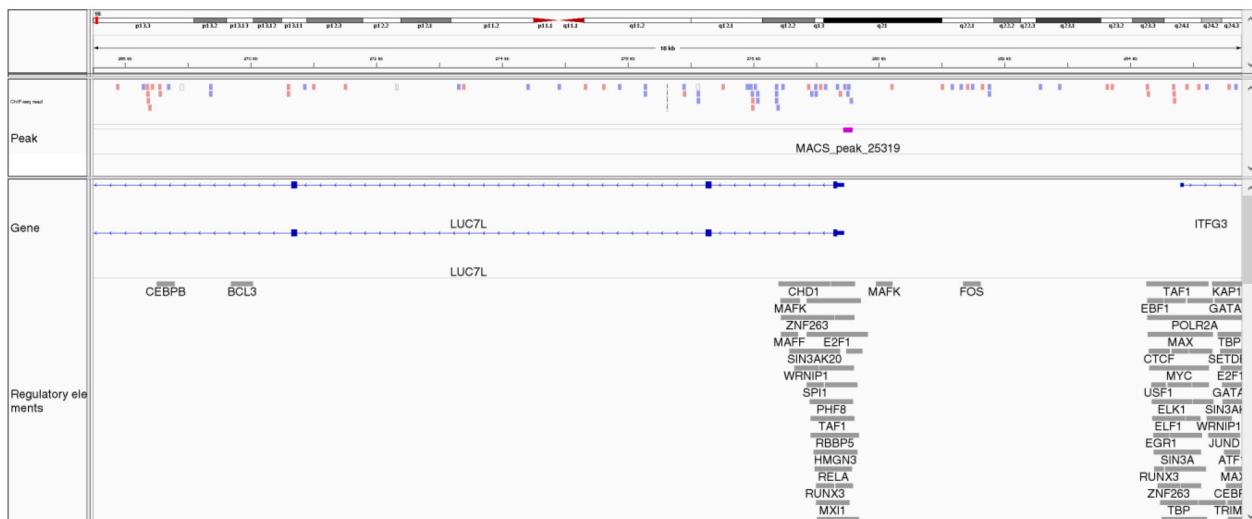

## ODC1 (ornithine decarboxylase 1)

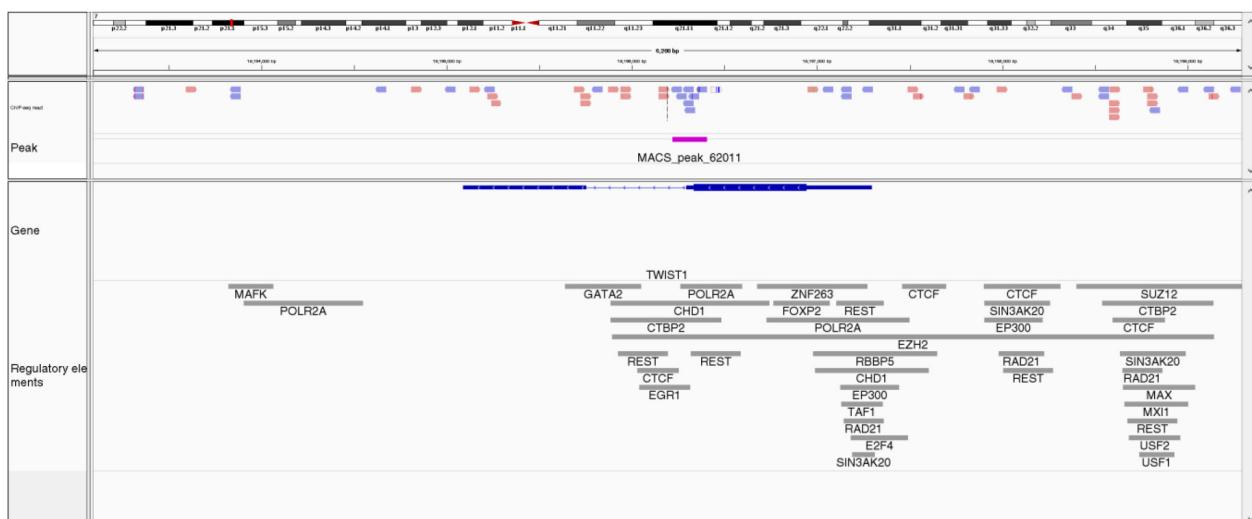

## BIRC5 (baculoviral IAP repeat containing 5)

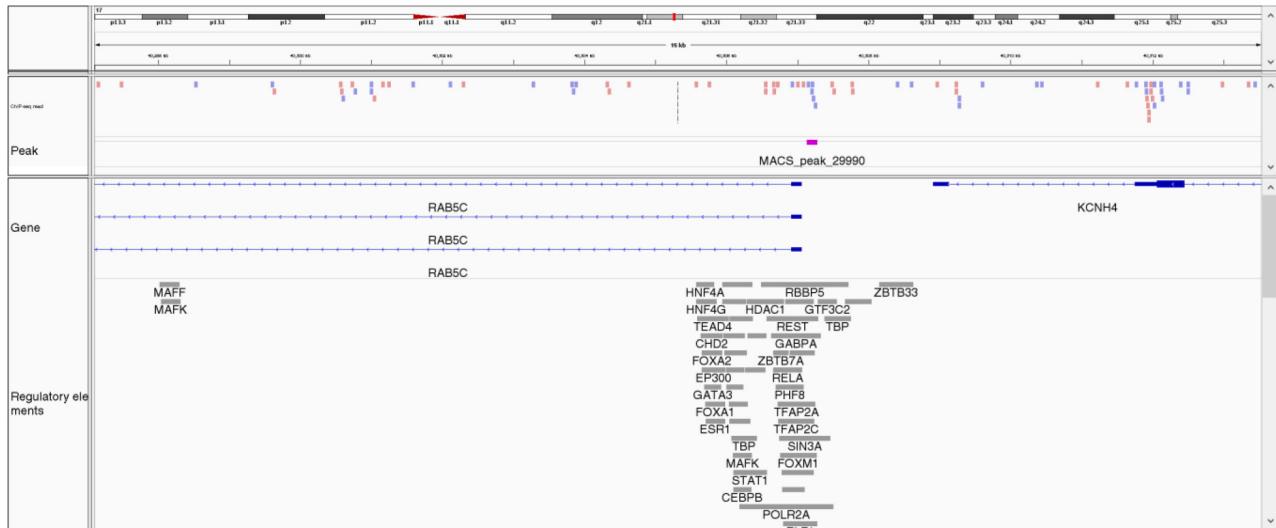

## LUC7L (LUC7-like)

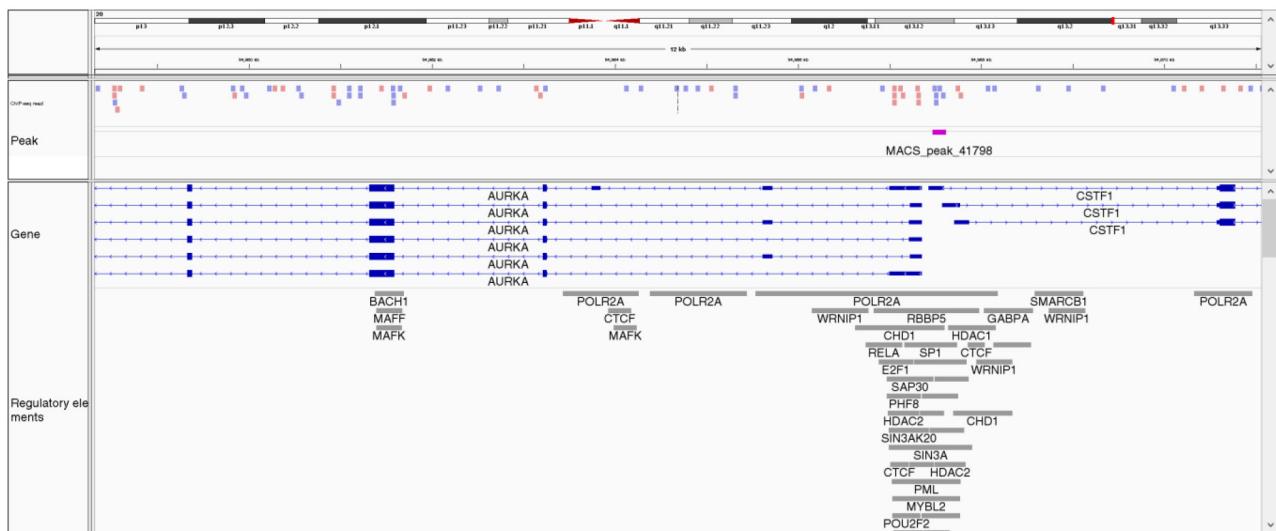

## TWIST1 (twist family bHLH transcription factor 1)

## RAB5C (baculoviral IAP repeat containing 5)

## AURKA (aurora kinase A)

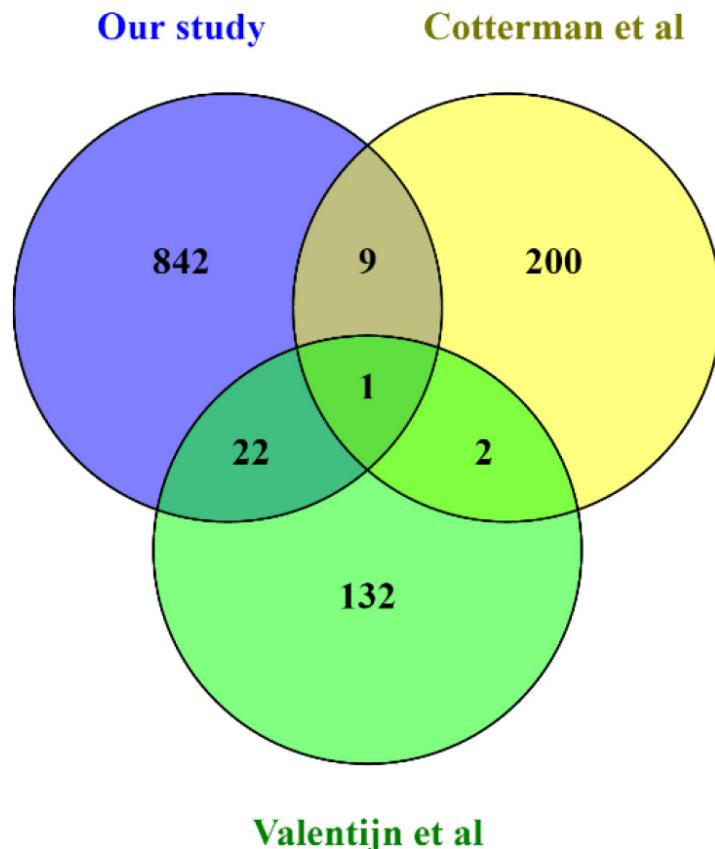

## H1F0 (H1 histone family, member 0)

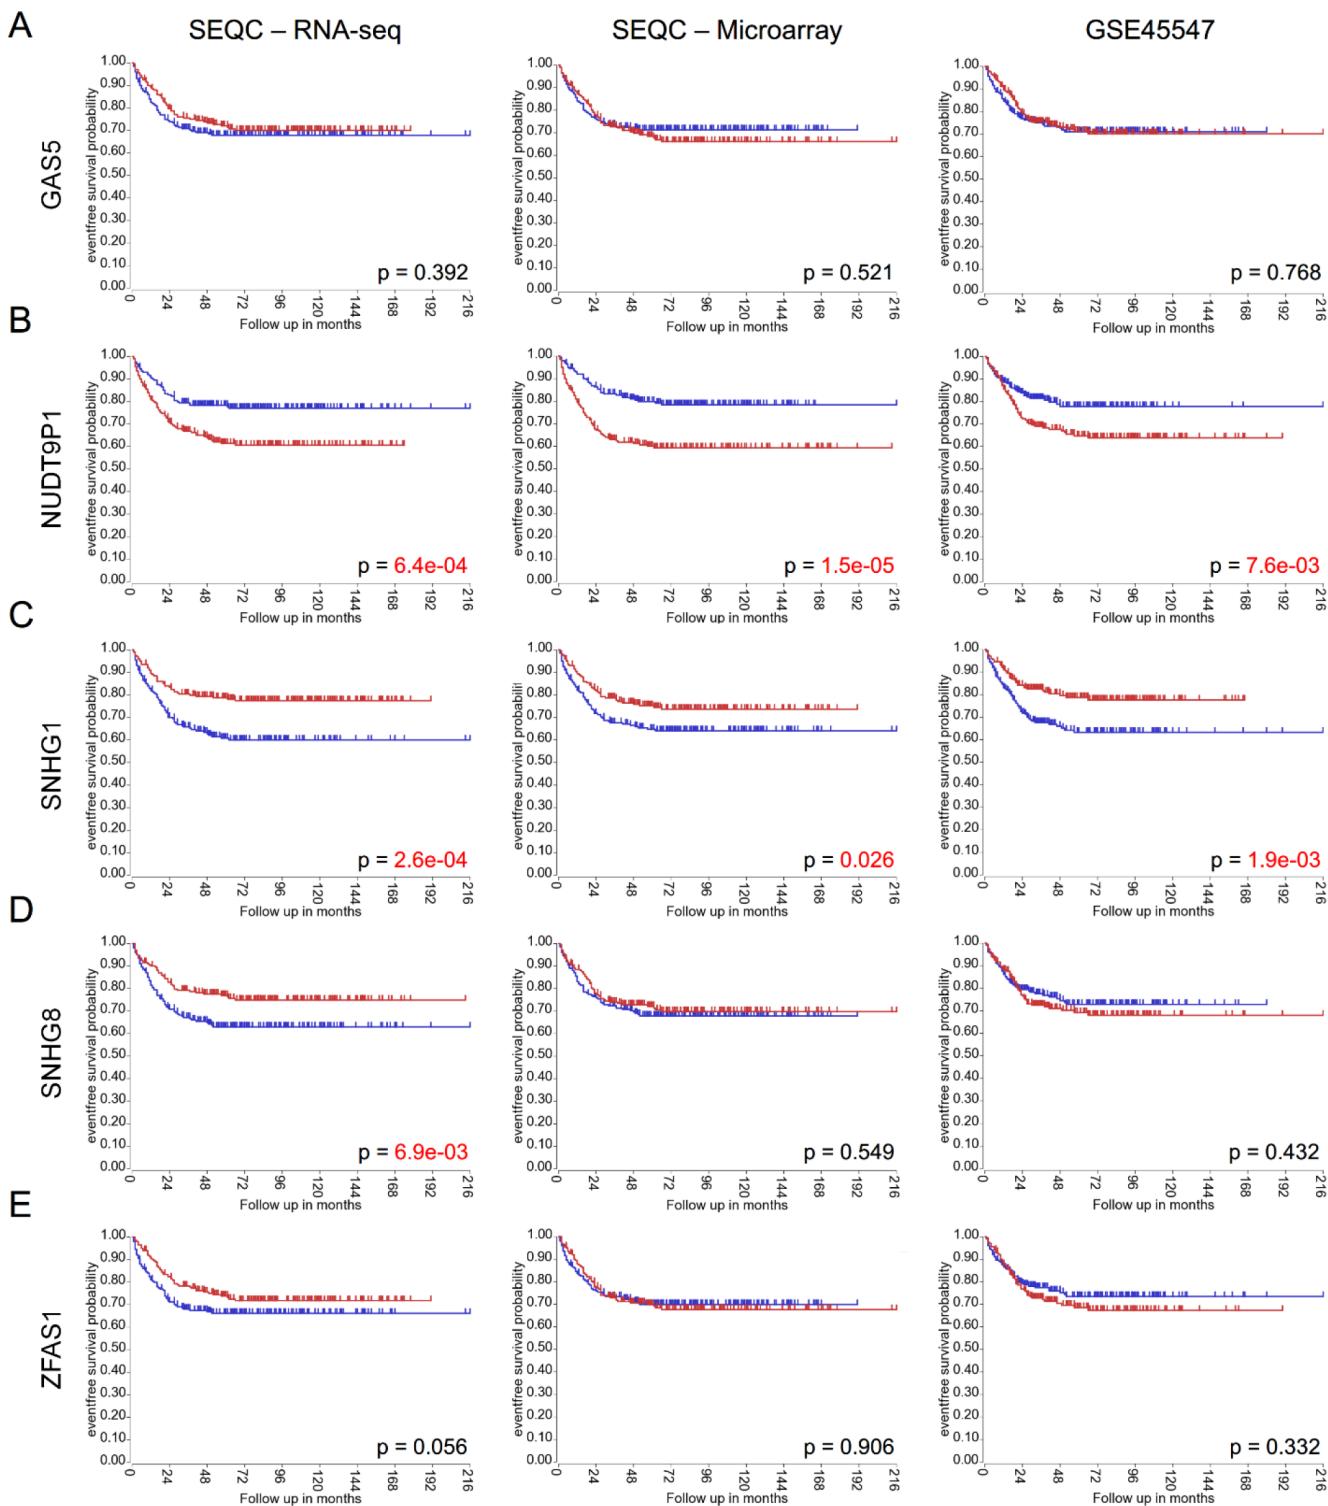

## MYBL2 (MYB proto-oncogene like 2)

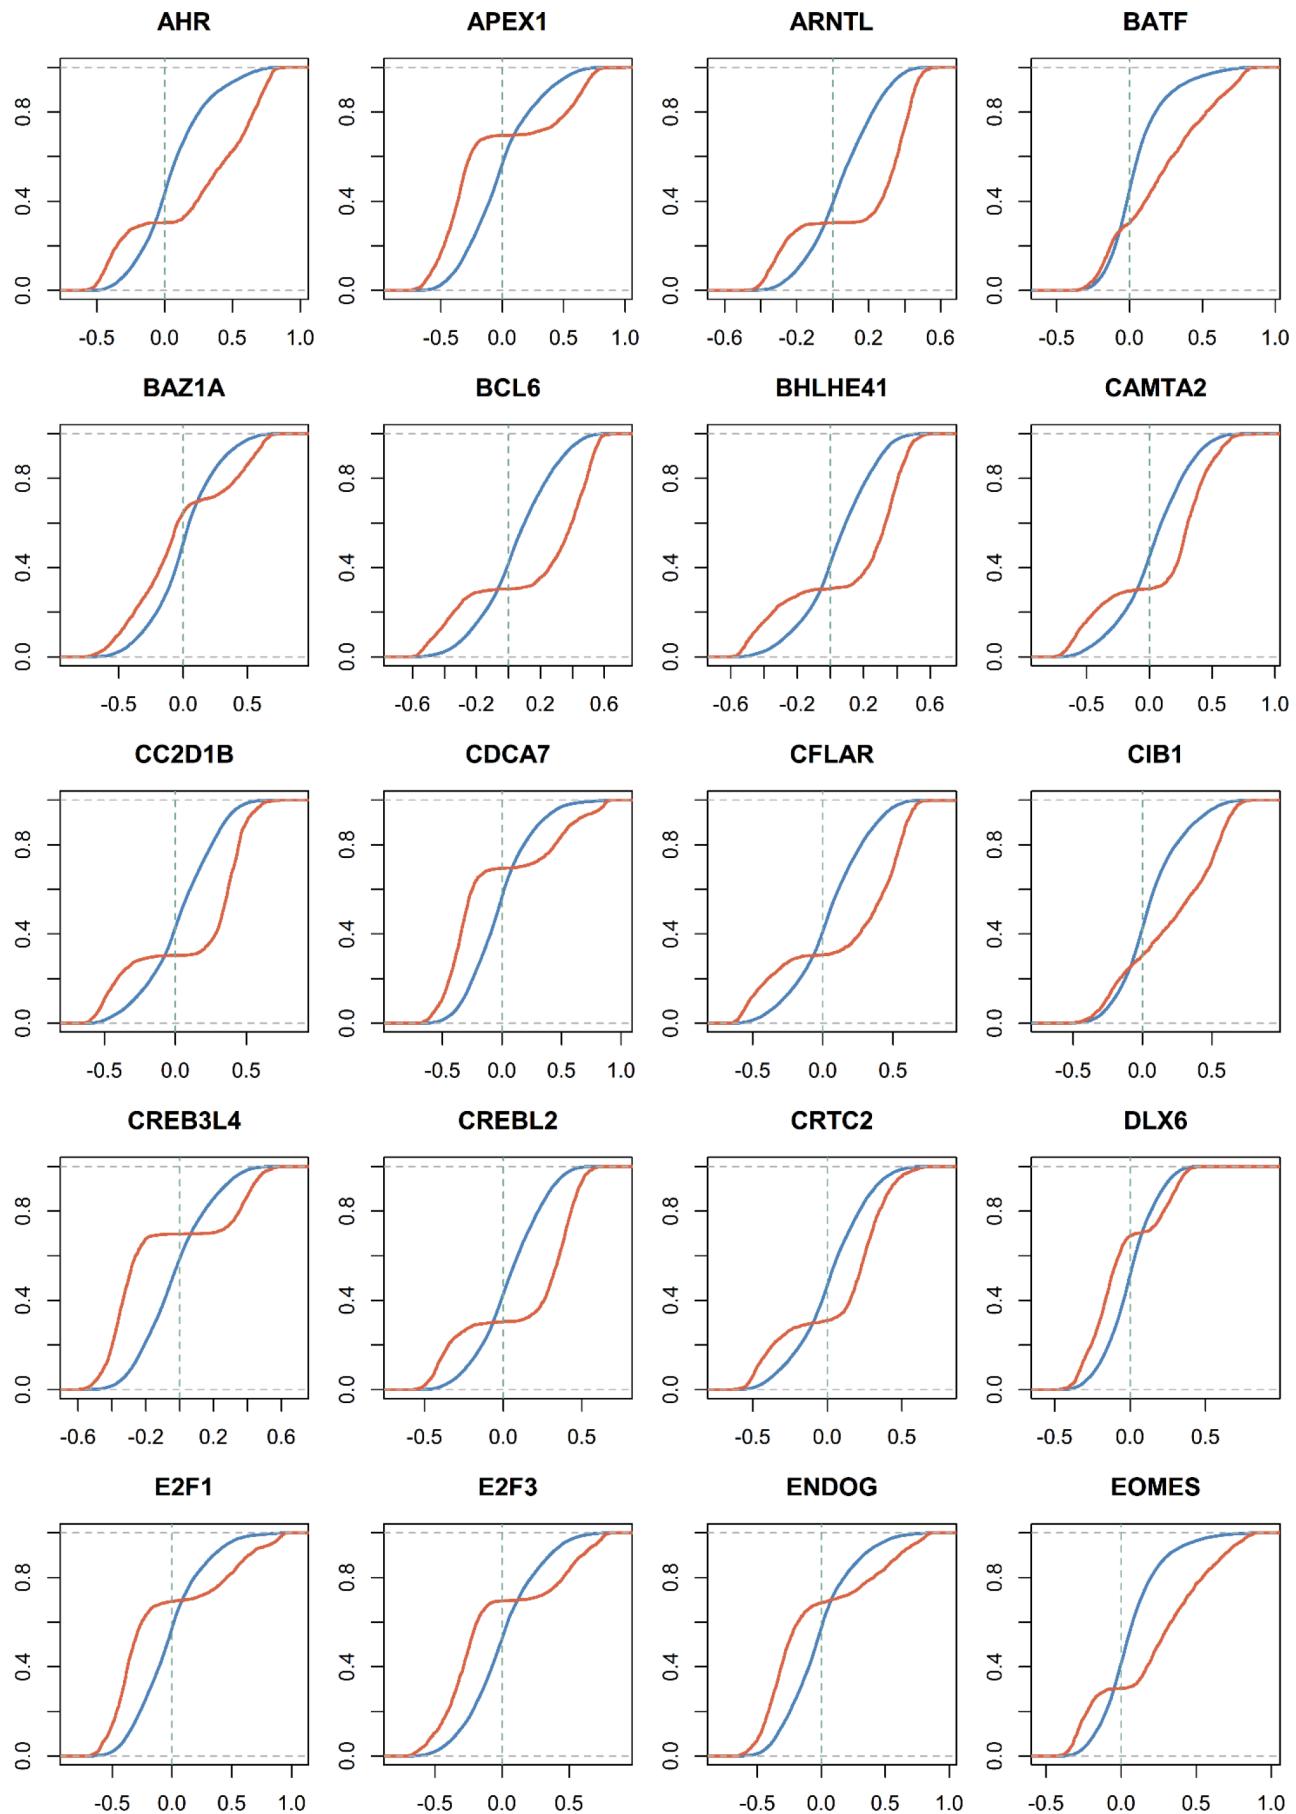

**Supplementary Figure S2: Genomic mapping of ChIP-seq data reveals binding of MYCN on the promoters of known MYCN-bound genes.** The ChIP-seq reads and peaks called by MACS were visualized by IGV (<http://www.broadinstitute.org/igv/>). The “regulatory elements” was obtained from UCSC genome browser (<https://genome.ucsc.edu/>).

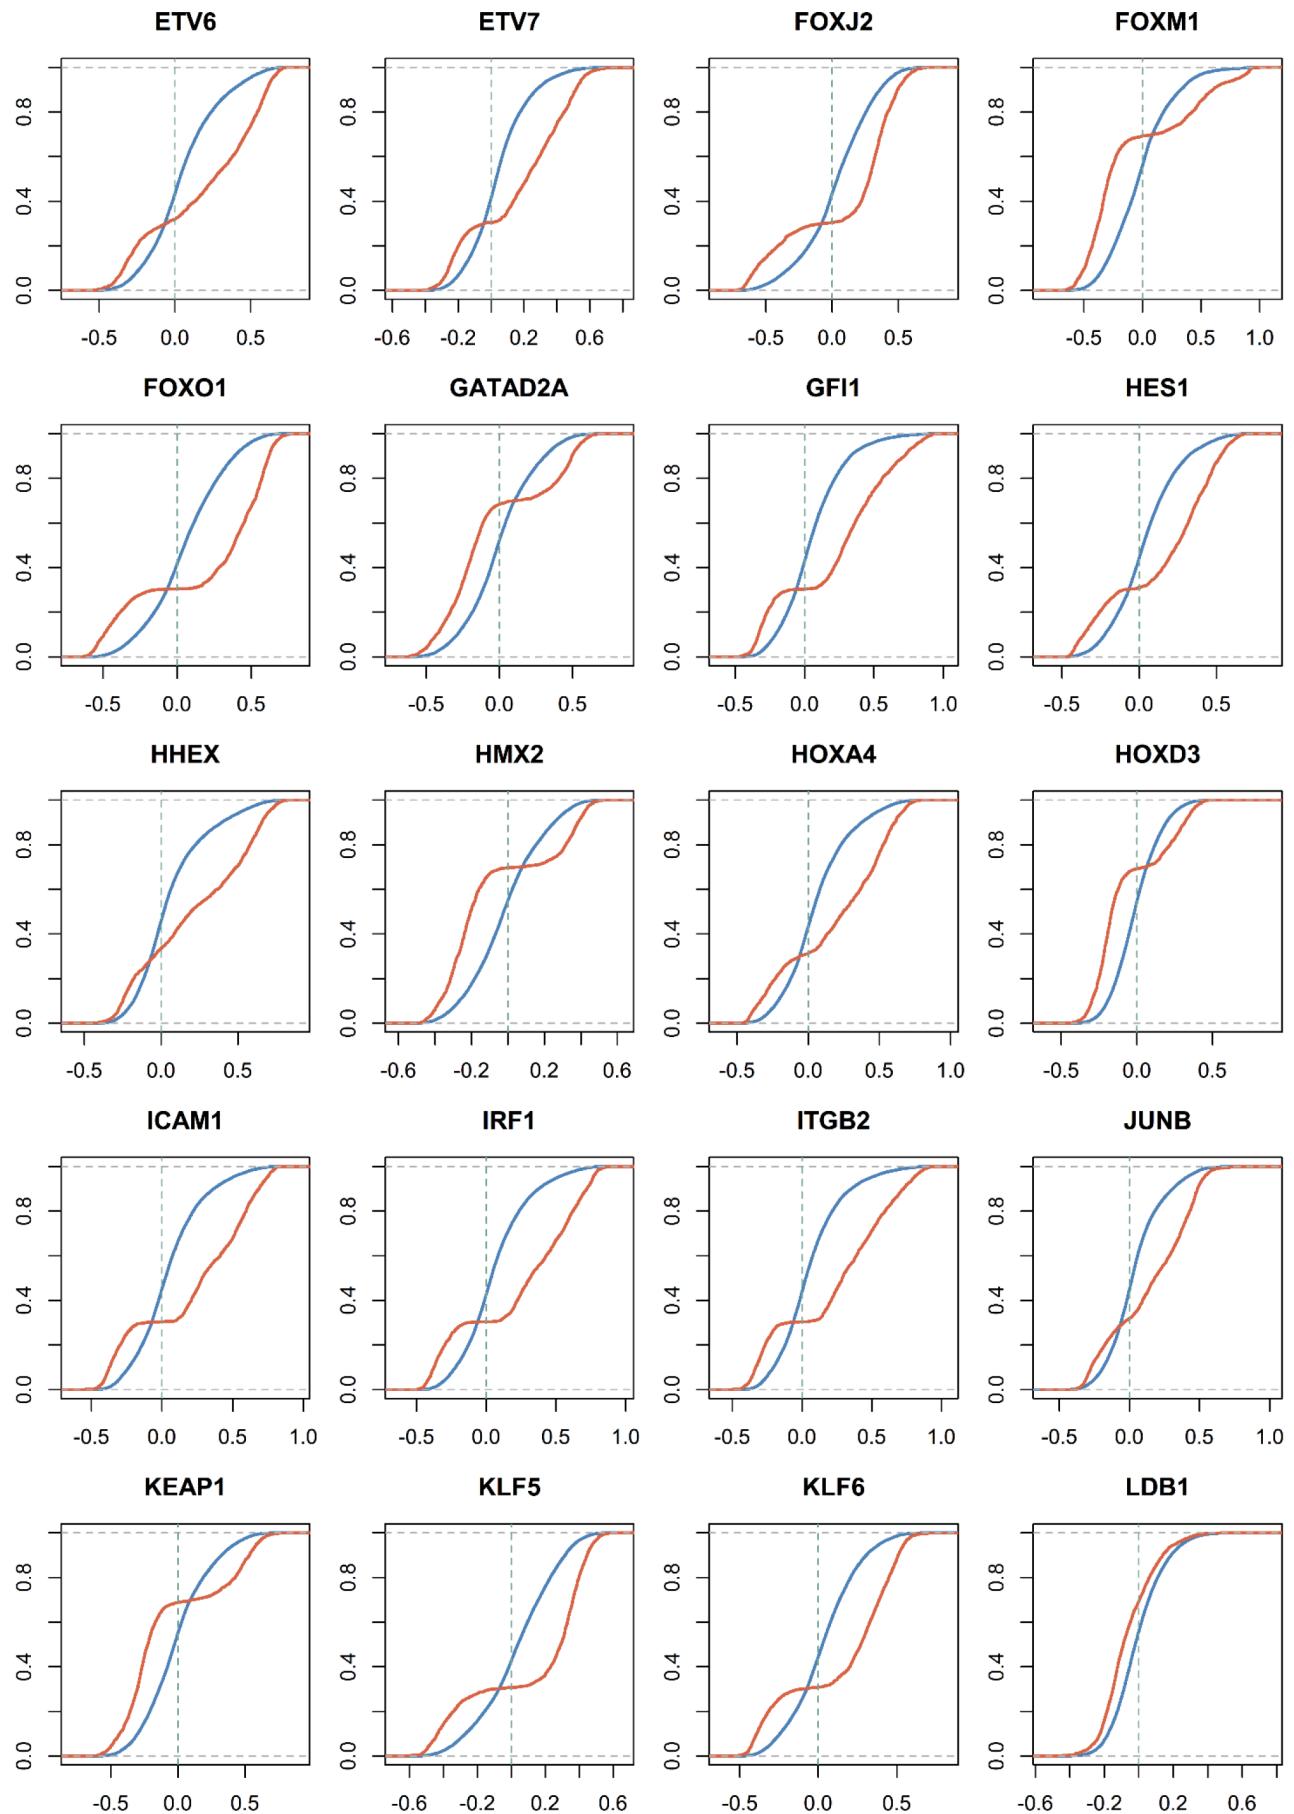

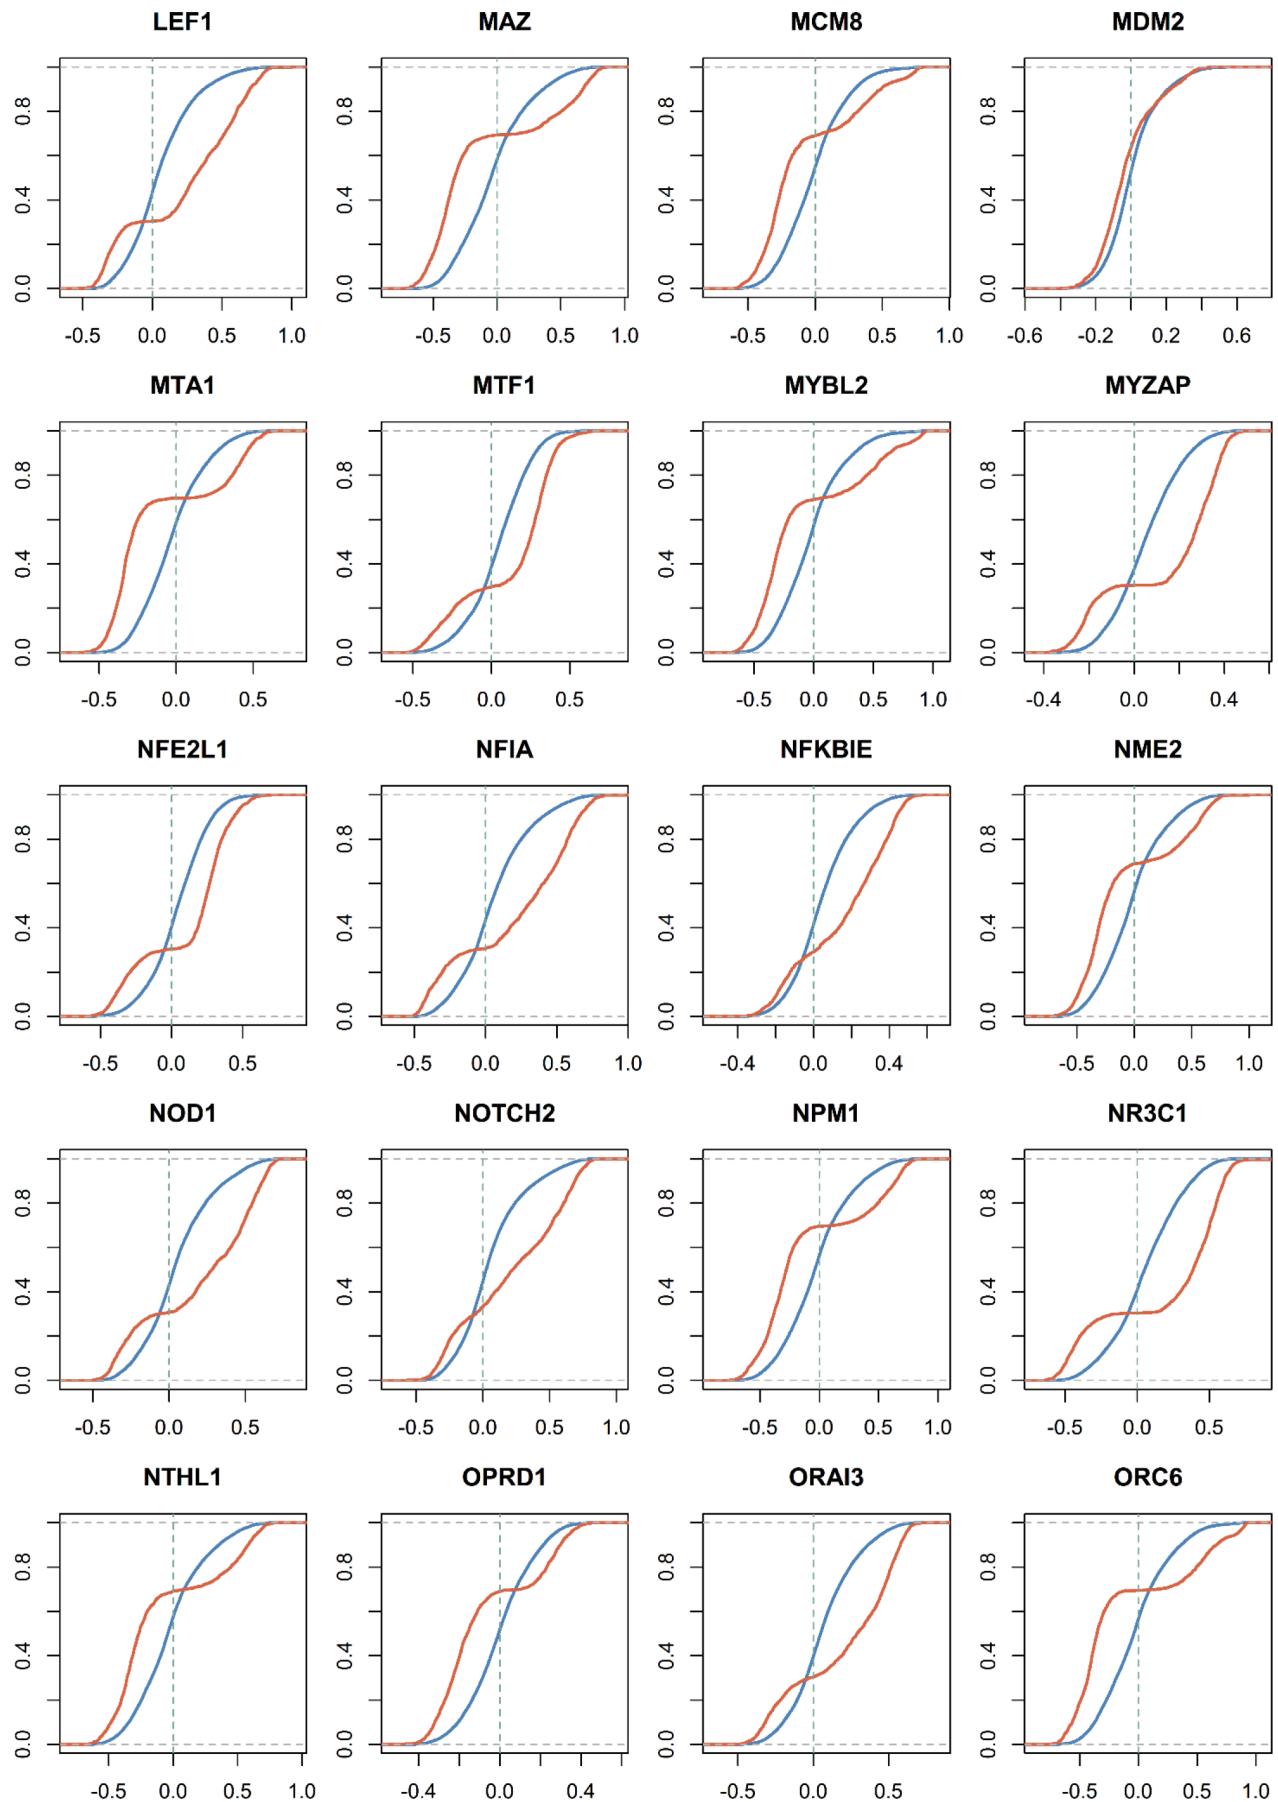

**Supplementary Figure S3: The comparison of MYCN-regulated genes identified by our method and other studies.**  
Cotterman et al. [2] and Valentijn et al. [3] identified 212 and 157 MYCN-regulated genes by integrating MYCN ChIP-chip and microarray experiments in IMR32 and TET21N cell lines, respectively.

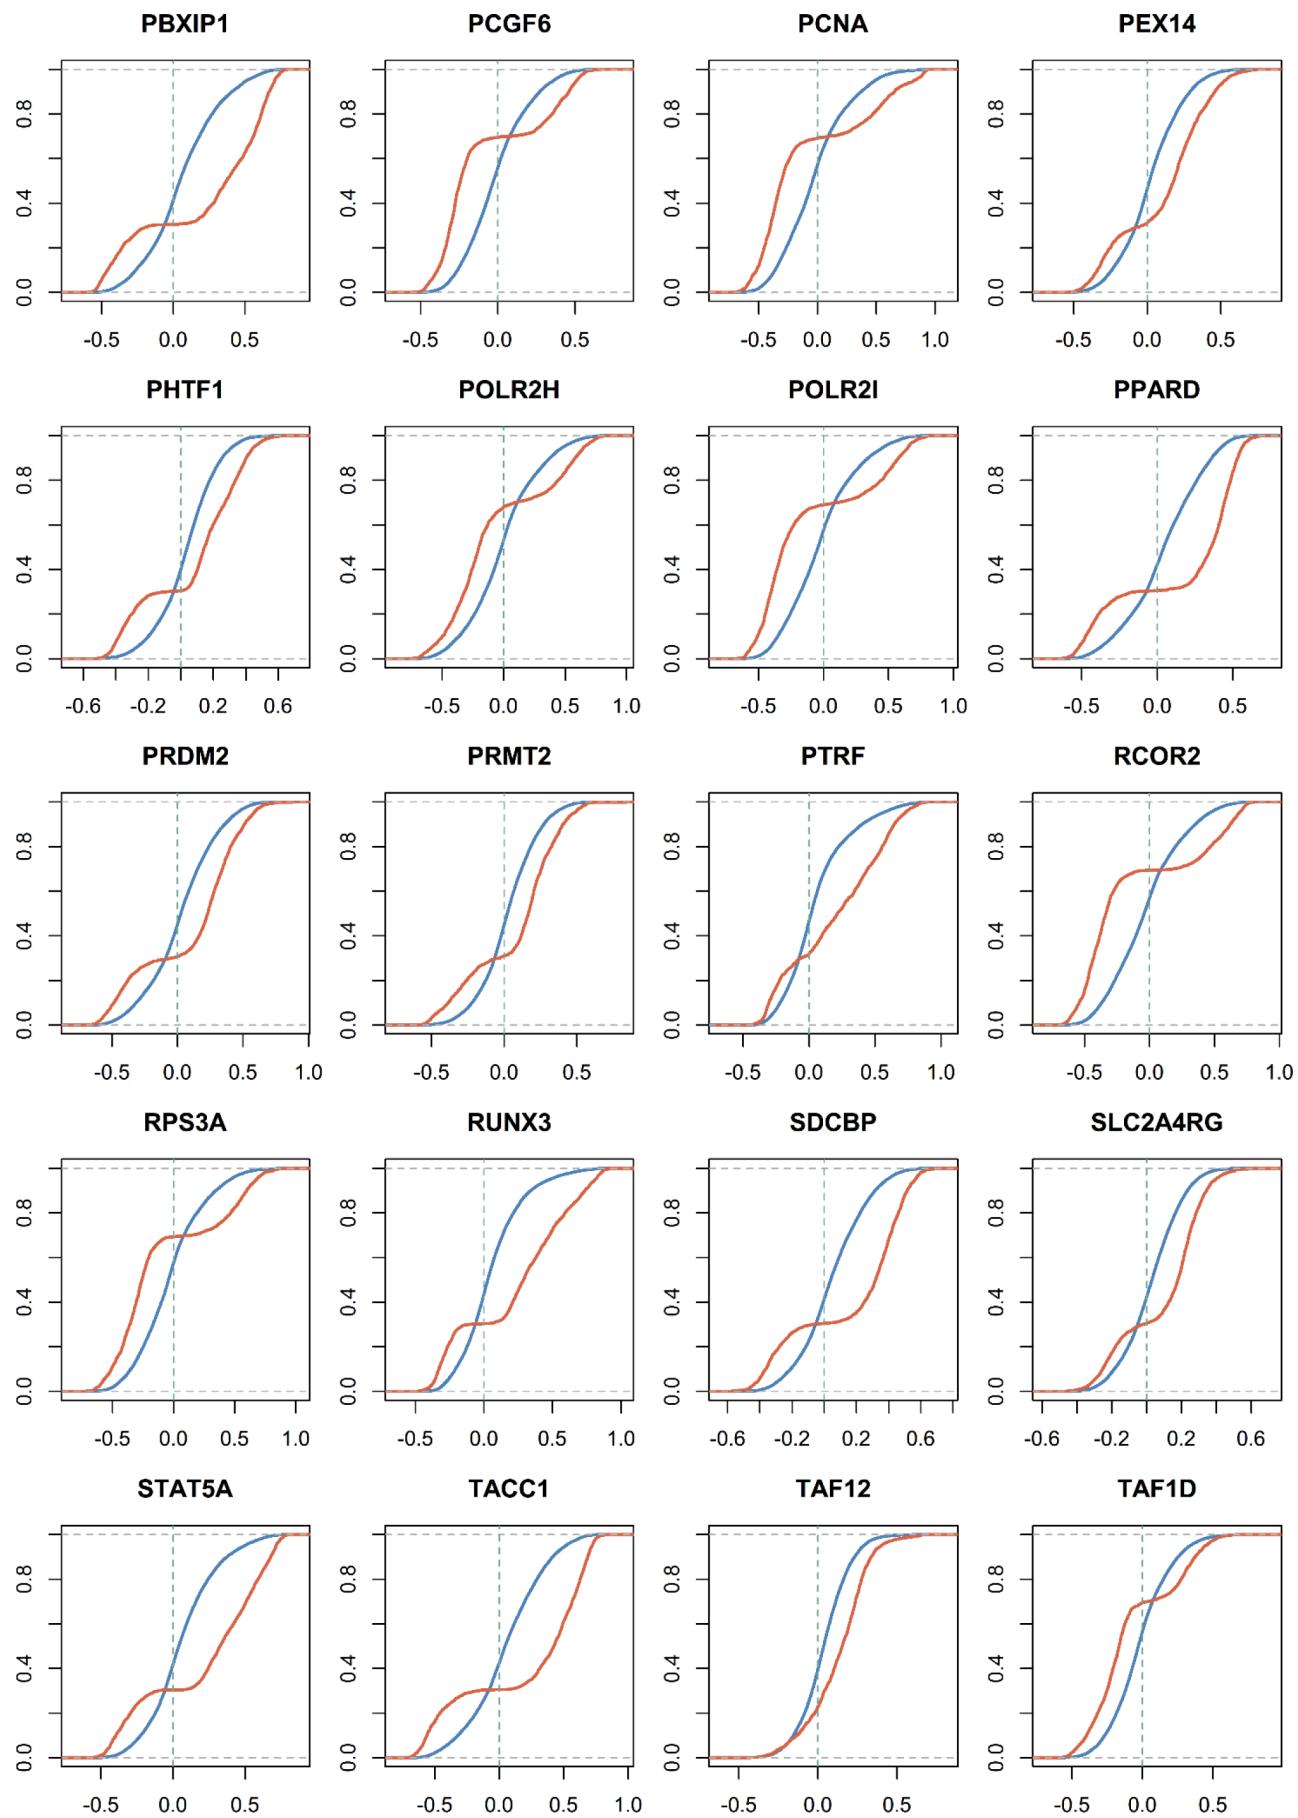

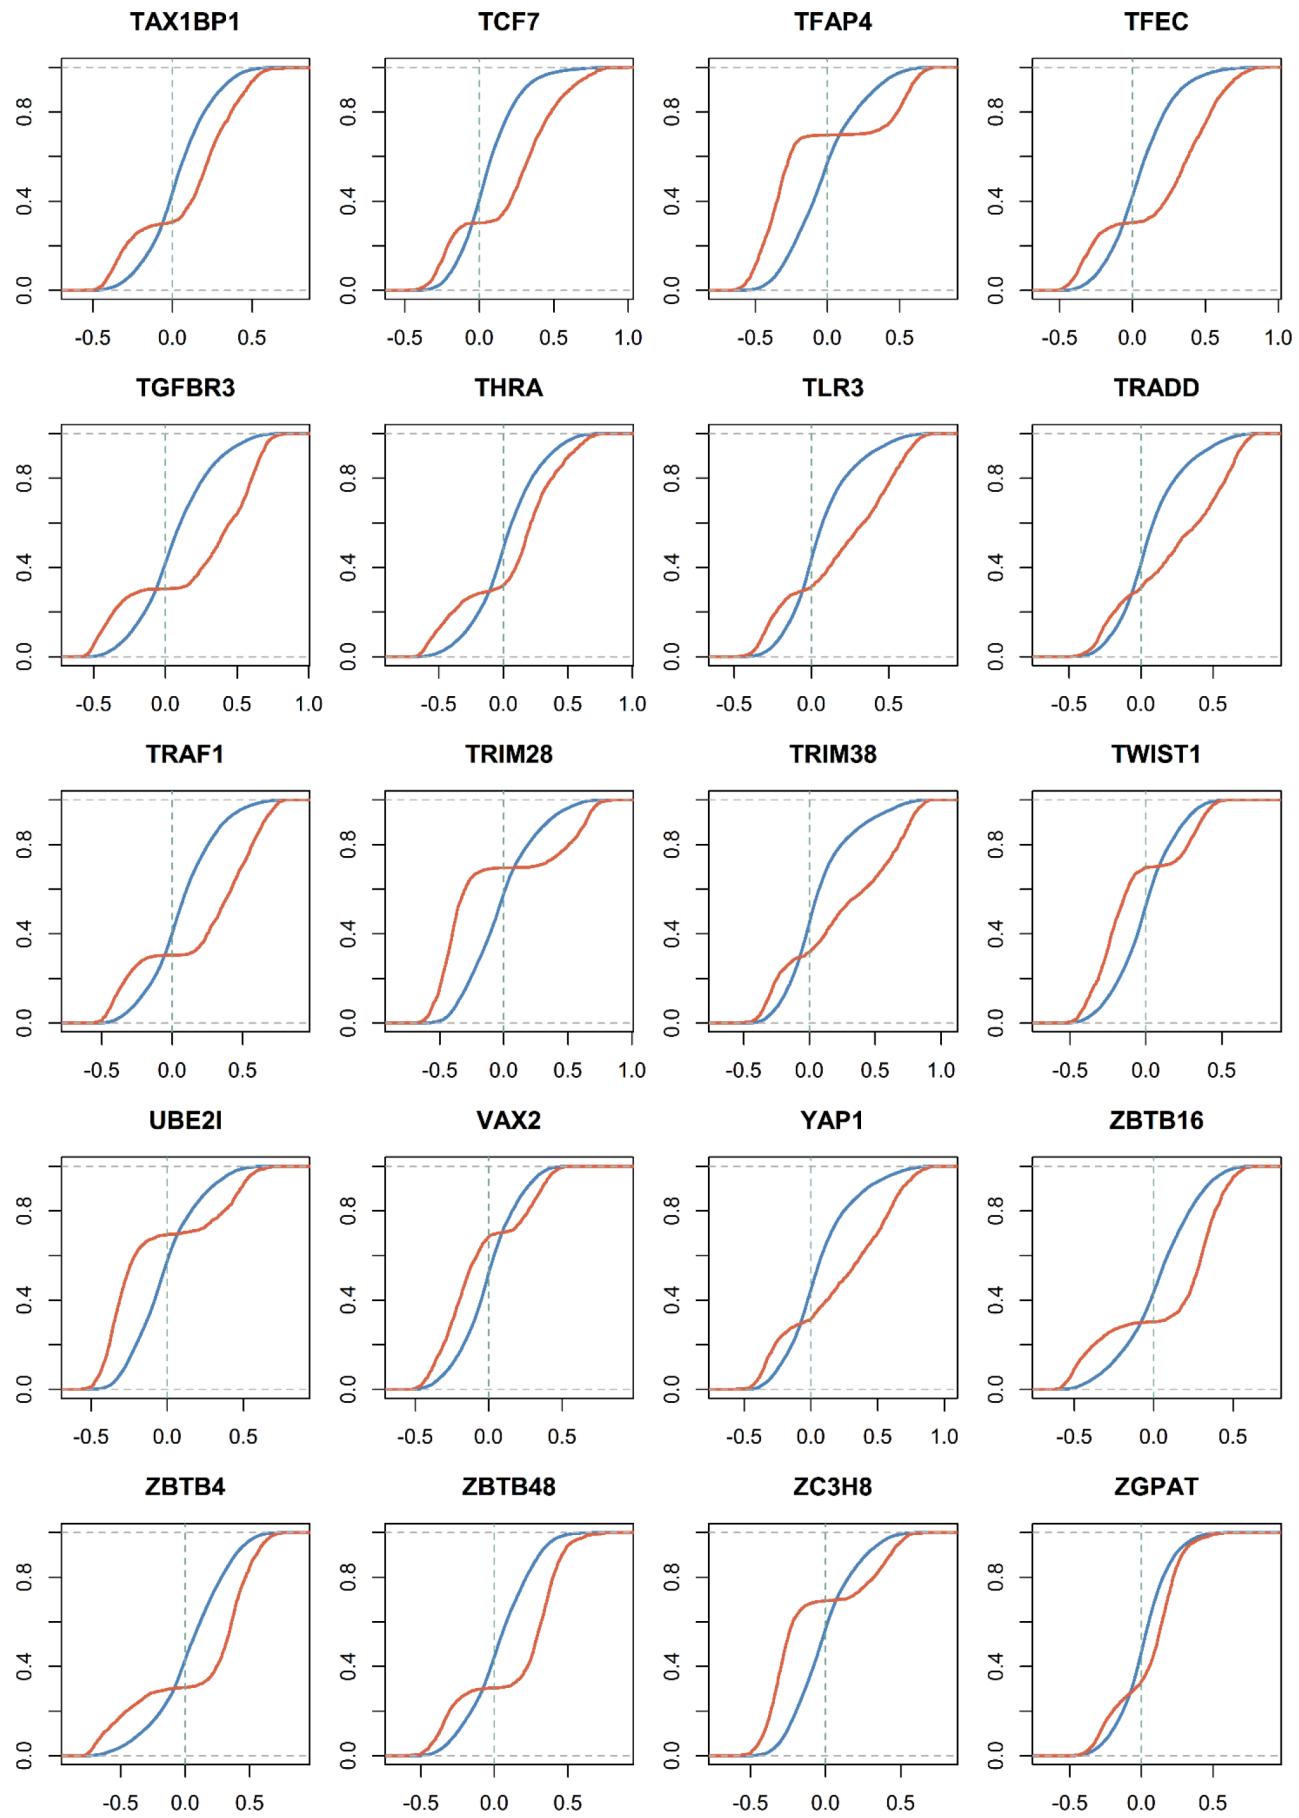

**Supplementary Figure S4: Some of MYCN-regulated long non-coding RNAs (lncRNAs) as a prognostic marker for neuroblastoma.** Kaplan-Meier curve indicating survival (in months) of patients with high (blue) and low (red) expression of five lncRNAs (GASS5 (A), NUDT9P1 (B), SNHG1 (C), SNHG8 (D), and ZFAS1 (E)) based on median values in three different cohort data. The figures are generated by R2 bioinformatics tool (<http://r2.amc.nl>). The indicated p values were obtained from Log-rank test.

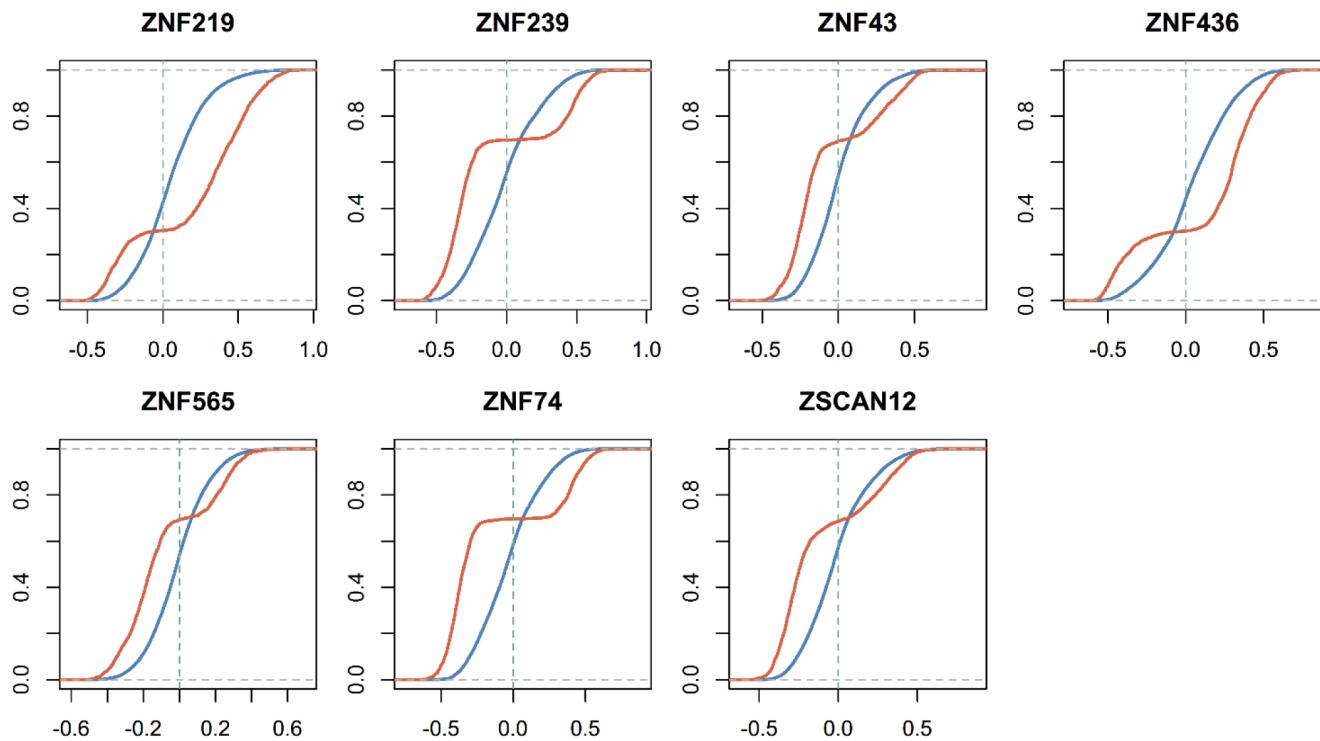

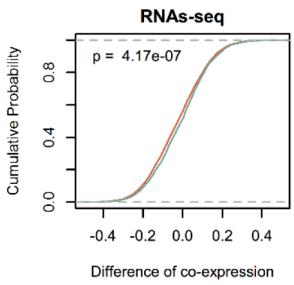

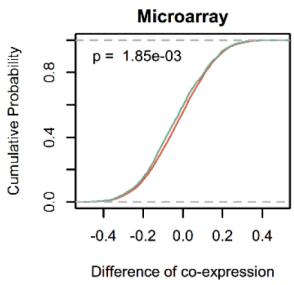

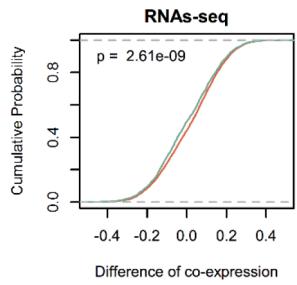

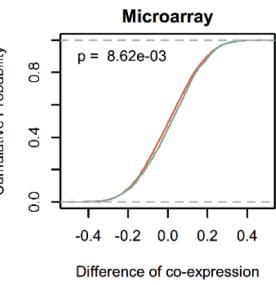

**Supplementary Figure S5: Correlation analysis between MYCN-correlated genes and MYCN-regulated transcription factors.** Red and green lines denote the correlation distribution of a given TF to MYCN-correlated genes and other genes, respectively. The x-axis is the Spearman correlation coefficient and the y-axis is the cumulative probability.

**Supplementary Figure S6: Differential coexpression of MYCN and other regulators to their co-targets.** Red and green lines denote the difference coexpression between MYCN and genes bound by MYCN as well as both MYCN and the given regulator, respectively. The  $p$  values are obtained from Kolmogorov–Smirnov test.

**Supplementary Figure S7: Distribution of confident score for miRNA-target relations.**
