**Fig. S1.** HE stained section of the liver of a NSG female mouse injected with NMuMG cells cultured in the presence of AlCl<sub>3</sub>  $100\mu$ M for 6 months. The mouse was from the same experiment described in Fig. 3. **B**) Cytokeratin 7 or **C**) Cytokeratin 19 immunohistochemistry on adjacent sections. Bar in A-C=  $50\mu$ m.

**Fig. S2.** NMuMG cells were seeded in 6 well plates at the density of 5'000 cells/well in triplicate, and cultured in the presence of the indicated concentrations of AlCl<sub>3</sub>, or of the same dilution of solvent ( $H_2O$ ) alone for 7 days. The graph shows the number of cells  $\pm$  SEM for each experimental condition at the end of the assay.
