

Figure S2. Percent variation in iTRAQ ratios between the same protein found in various replicates following MS. The primary vertical axis represents the corresponding number of the proteins (bars) having different % co-efficient of variation (%CV) that was plotted in the horizontal axis. The secondary vertical axis represents the cumulative % of the counted proteins (lines). Eighty eight percent of the proteins had less than 66% of %CV. Accordingly; the regulation cut-off was set at 1.66-fold and 0.6-fold (1/1.66).
