

Supplemental Figure 1. PMA-treated THP-1 were unstimulated or stimulated with mAb, 1 μ m polystyrene beads alone (beads), beads coated with mAb (mAb-coated beads), iFt with uncoated beads (iFt + beads), or iFt with mAb-coated beads (iFt+mAb-coated beads) and cell-free culture supernatants were analyzed for IL-1 β by ELISA following 24 h of stimulation. Results are averages of three independent experiments with error bars indicating SEM.
