

Supplemental Figure 2. HEK293T cells were transfected with plasmids encoding pro-caspase1 (50 ng), pro-IL1 β (200 ng), ASC (10 ng), with or without an NLRP3 (100 ng) and with or without constitutively-active Y325D mutant SYK (100 ng). After 24 h, culture supernatants were collected by centrifugation, and secreted IL-1 β was measured by ELISA. Results are representative of three independent experiments with error bars indicating standard deviation.
