Supplementary Fig. 1.

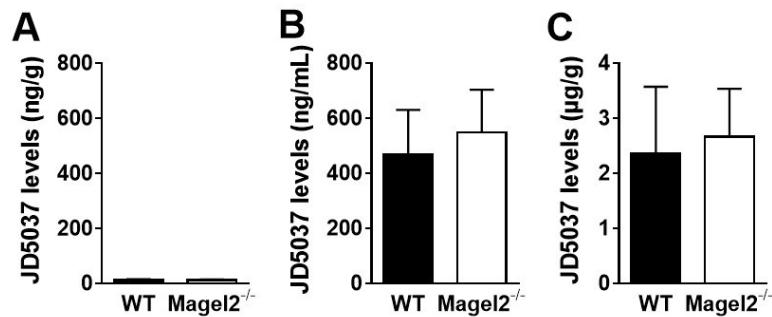

Analysis of covariance (ANCOVA) for calculating metabolic data. Logarithms of body mass and of the resting metabolic rate that were regressed against each other. The slopes of the regression curves were used as the power to which body mass was raised in order to yield the panels describing TEE, FO and CHO in *Figures 2 & 7*, in proportion to their metabolic rate.

Supplementary Fig. 2.

Altered body composition in *Magel2*-null mice fed either a STD or a HFD. *Magel2*-null mice and their littermate wild-type control animals were fed either a STD (A-F) or a HFD (G-L) for 12 weeks. Changes in body weight (A, B, G, H), fat mass (C, D, I, J), and lean mass (E, F, K, L) were measured in both male (A, C, E, G, I, K) and female (B, D, F, H, J, L) mice. Data represent the mean \pm SEM from 15-23 mice per group. * $P<0.05$ relative to wild-type controls of the same sex.

Supplementary Fig. 3.

Low levels of JD5037 in the brain in *Magel2*-null and littermate control mice. Brain (A), serum (B), and liver (C) levels of JD5037 1 h following an acute administration at 3 mg/kg. Data represent the mean \pm SEM from 3 mice per group. * $P<0.05$ relative wild-type controls.
