Supplementary figure 1. Multiple sequence alignment of the GDU1-similar proteins from plants.

Genbank EST database was searched with GDU1 protein sequence using tBLASTn. Only plant ESTs (104) displayed a significant score. Ninety-eight ESTs were successfully grouped into 44 contigs which were translated into proteins. Genbank genome database search identified GDU1-similar sequences in *Arabidopsis*, rice and Alfalfa. The EST- and genome-derived protein sequences were aligned using Clustal X (Thompson et al., 1997). Similar residues are shaded (>60% conservation in dark gray, >40% conservation in bright gray). Only the sequences flanking the membrane domain and the VIMAG domain are shown.
