

Supplementary information, Figure S2 RNA was isolated when PA14 WT, ΔTCR, Δ*lasR* and their complementary strains grew at an OD_{600nm} of 2.0 in M9 medium. Transcripts of indicated QS regulators and virulence factors in PA14 strains were quantified by qPCR. Data are representative of three independent experiments expressed as means ± SEM (one-way ANOVA with Tukey's post hoc; * $p \leq 0.05$; ** $p \leq 0.005$).
