

## **Supplementary information:**

### **Cubozoan genome illuminates functional diversification of opsins and photoreceptor evolution**

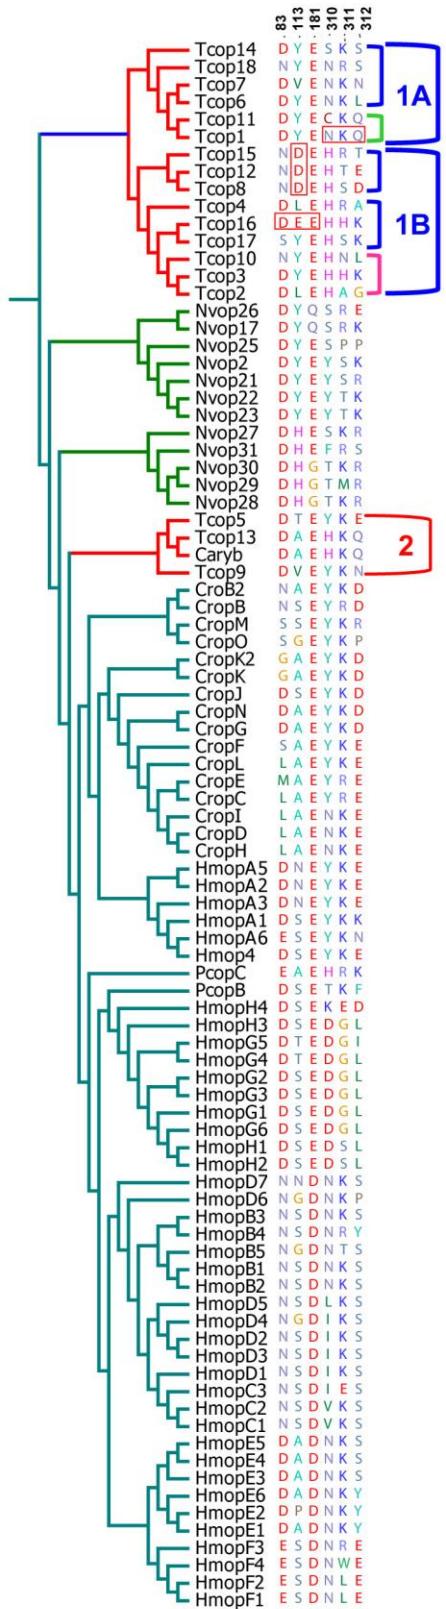

**Michaela Liegertová<sup>1a</sup>, Jiří Pergner<sup>1a</sup>, Iryna Kozmíková<sup>1</sup>, Peter Fabian<sup>1</sup>, Antonio R. Pombinho<sup>2</sup>, Hynek Strnad<sup>3</sup>, Jan Pačes<sup>3</sup>, Čestmír Vlček<sup>3</sup>, Petr Bartůněk<sup>2</sup> and Zbyněk Kozmík<sup>1\*</sup>**

**Figure S1 - Pairwise sequence alignment of Tcop13 and *Carybdea rastonii* opsin**

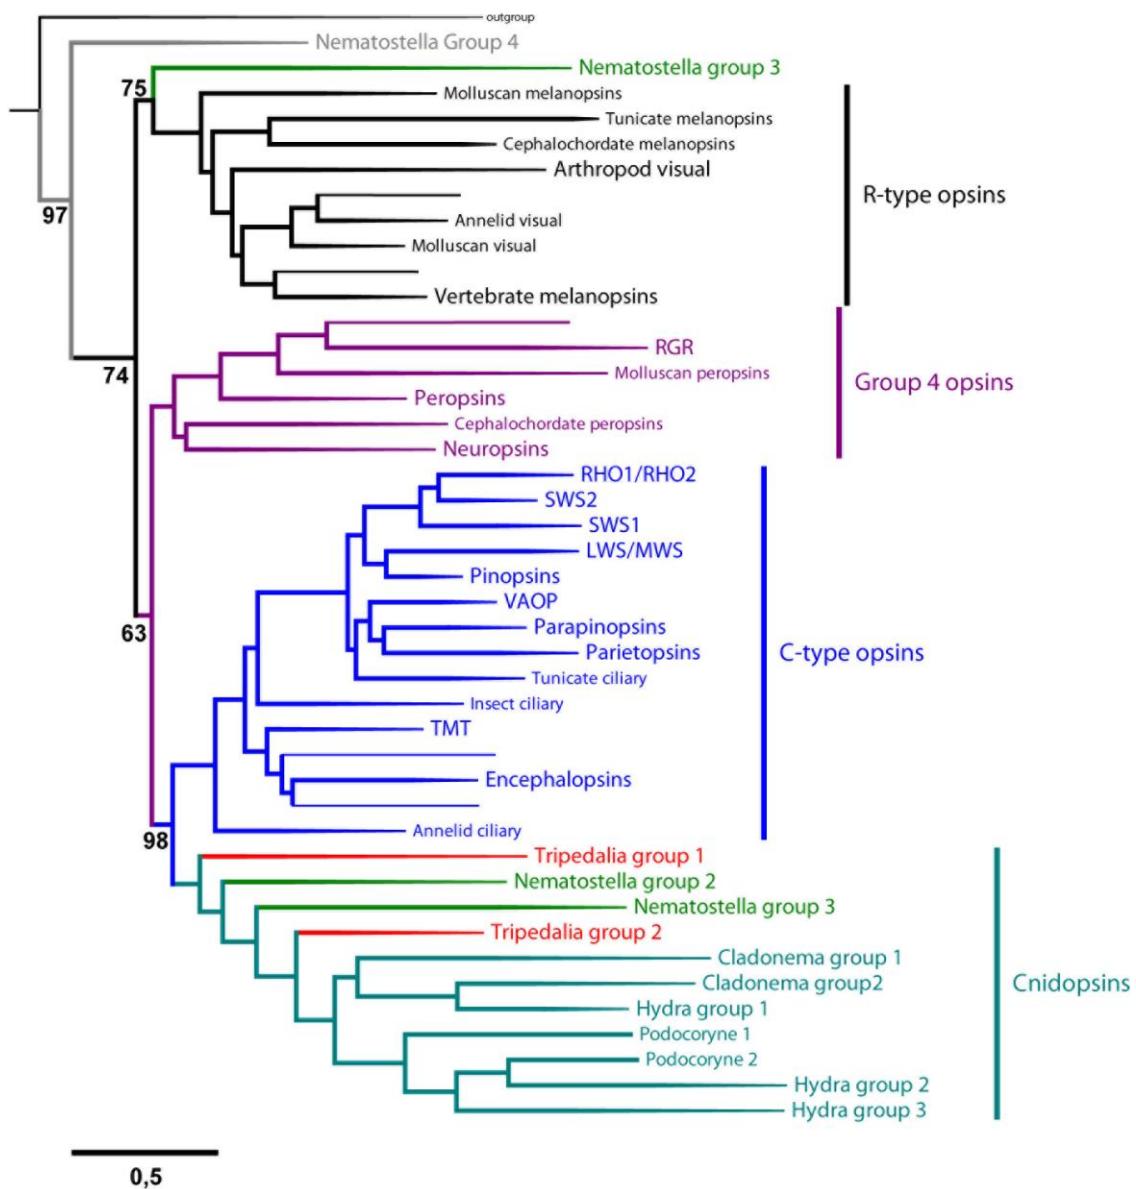

Alignment showing homology between opsins, Tcop13 and Caryb, from two cubozoan species

*Tripedalia cystophora* and *Carybdea rastonii*. Calculated sequence identity 93 %.

**Figure S2 – Comparison of counterion and tripeptide diversity within cnidopsins**

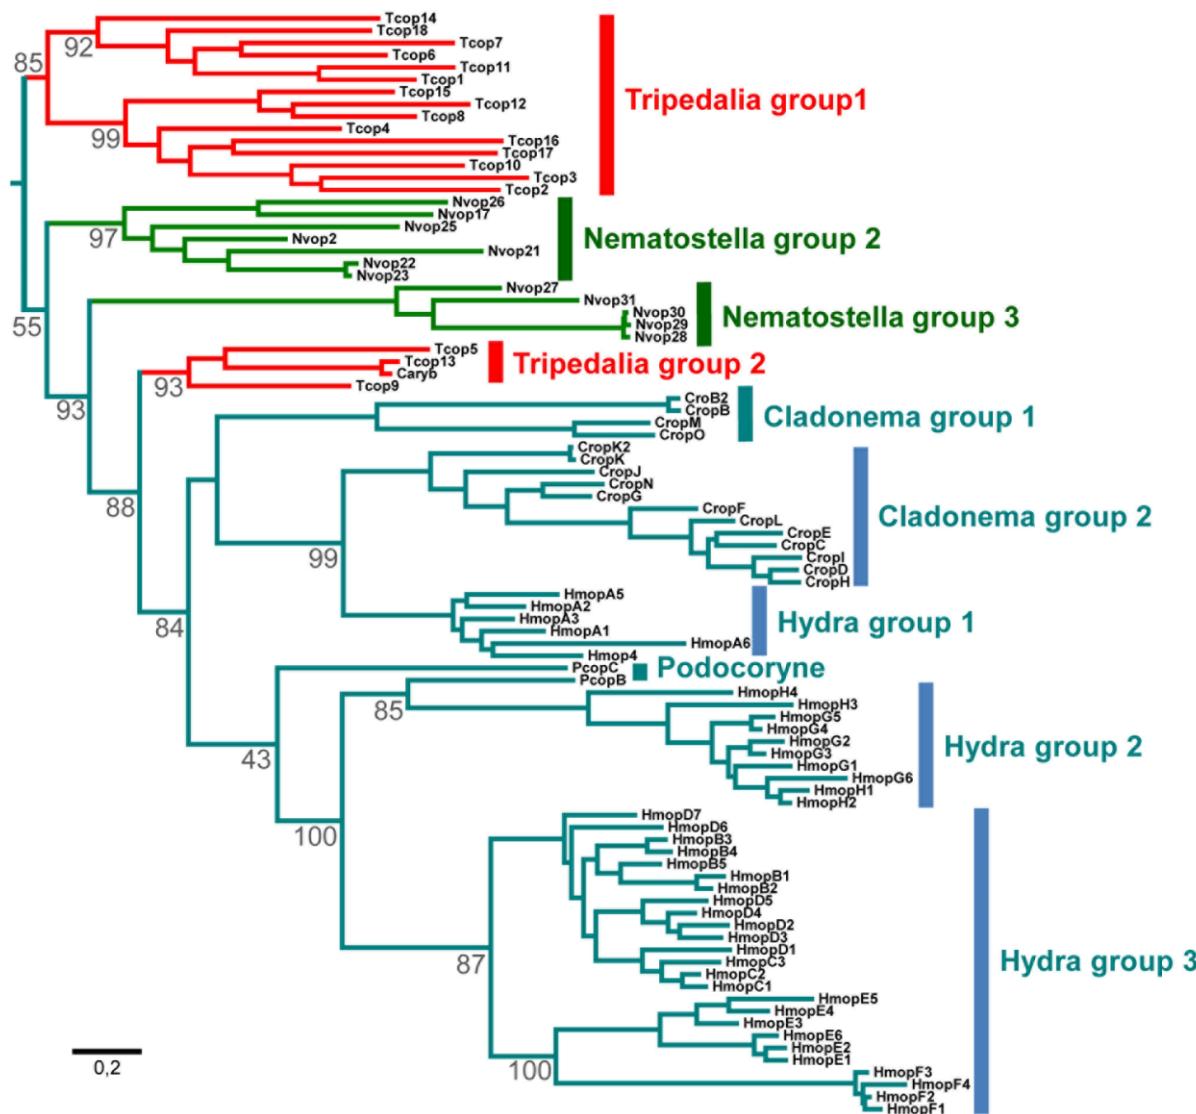

Partial sequence alignment of amino acid residues at three potential counterion sites (bovine rhodopsin sites 83, 113, 181) and the G protein-binding tripeptide (bovine rhodopsin sites 310, 311, 312) within the cnidopsin branch. Interesting amino acid residues are highlighted by red box. Tcop – *Tripedalia cystophora* (Cubozoa); Nvop – *Nematostella vectensis* (Anthozoa); Crop – *Cladonema radiatum* (Hydrozoa); Hmop – *Hydra magnipapillata* (Hydrozoa); Caryb – *Carybdea rastonii* (Cubozoa).

**Figure S3 – Maximum-likelihood tree of the opsin family**

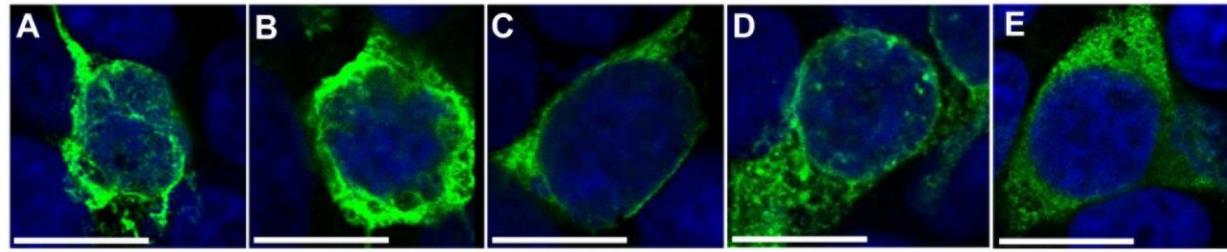

The maximum-likelihood tree of 801 protein sequences with the branches collapsed into well-supported clades where possible. Approximate Likelihood-Ratio Test (aLRT) branch support values (%) are shown for major groups. The four major opsin clades have been labeled. R-type opsin group: arthropod visual pigments (M/LWS, SWS); annelid and molluscan visual pigments; vertebrate

melanopsins; uncharacterized tunicate, cephalochordate and molluscan opsins. Group 4 opsins: neuropsins; peropsins; RGR and uncharacterized cephalochordate and molluscan peropsins. C-type opsin group: vertebrate visual pigments (Rh1, Rh2, SWS1, SWS2, M/LWS); pinopsins; parapinopsins; vertebrate ancient opsins (VAOP); parietal opsins; teleost multiple tissue opsins (TMTs); encephalopsins; tunicate ciliary opsins; ptersopsins and insect ciliary opsins; uncharacterized annelid ciliary opsins. Cnidopsins: cnidarian opsins including representatives from hydrozoans, anthozoans and cubozoans. Nematostella group 4 and 1 are novel cnidarian opsin subfamilies, which do not cluster within the cnidopsin group.

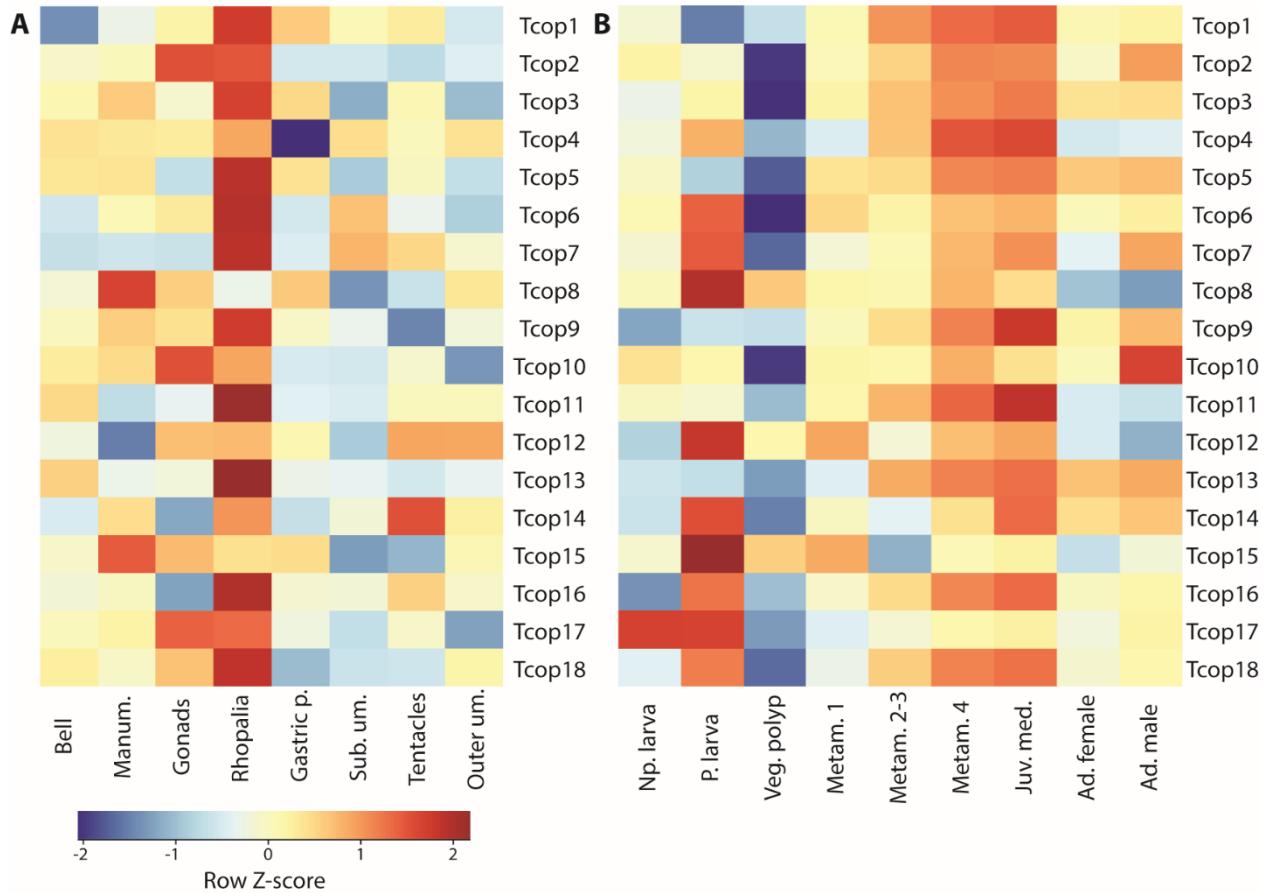

**Figure S4 – Zoom into the cnidopsin branch of the opsin family maximum-likelihood tree**

The major cnidopsin clades have been labeled. Approximate Likelihood-Ratio Test (aLRT) branch support values (%) are shown for major groups. Tcop – *Tripedalia cystophora* (Cubozoa); Nvop – *Nematostella vectensis* (Anthozoa); Crop – *Cladonema radiatum* (Hydrozoa); Hmop – *Hydra magnipapillata* (Hydrozoa); Caryb – *Carybdea rastonii*.

**Figure S5 – Expression of recombinant *T. cystophora* opsins in GloSensor™ cAMP HEK293 cells**

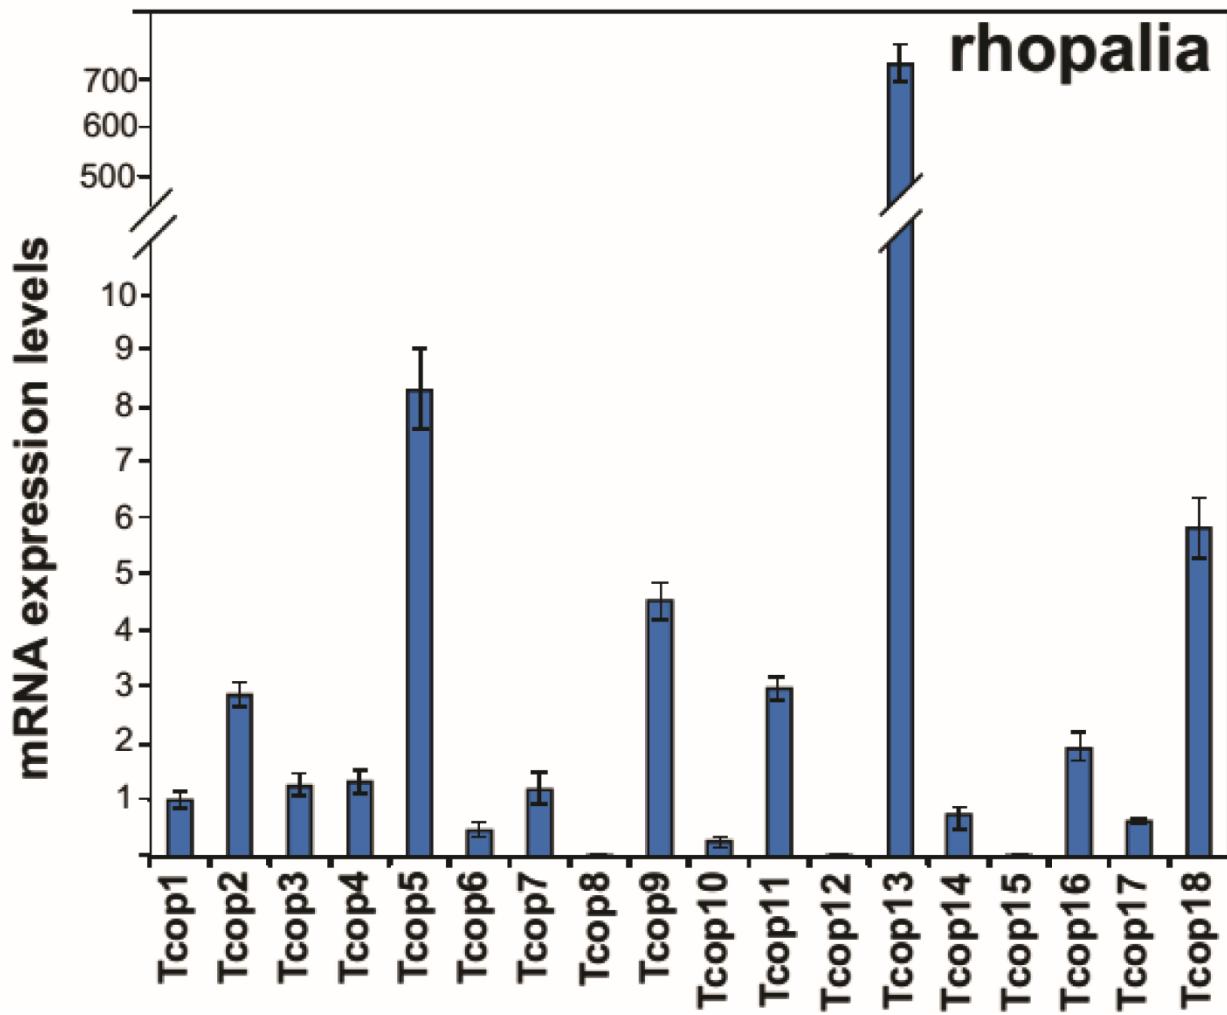

**A-D)** Opsins tagged with 1D4 tag were expressed in GloSensor™ cAMP HEK293 cells (Promega) and stained as described in Materials and Methods (blue – DAPI and green – 1D4 tag). Opsin signals were detected on the cell membrane. **A)** Tcop5. **B)** Tcop13. **C)** Tcop18. **D)** Tcop9. **E)** *Oryzias latipes* rhodopsin used as control. (Scale bars: 10 μm)

**Figure S6 – mRNA expression levels of individual *T. cystophora* opsins in dissected body parts of adult jellyfish and life stages displayed as Z-score heat map**

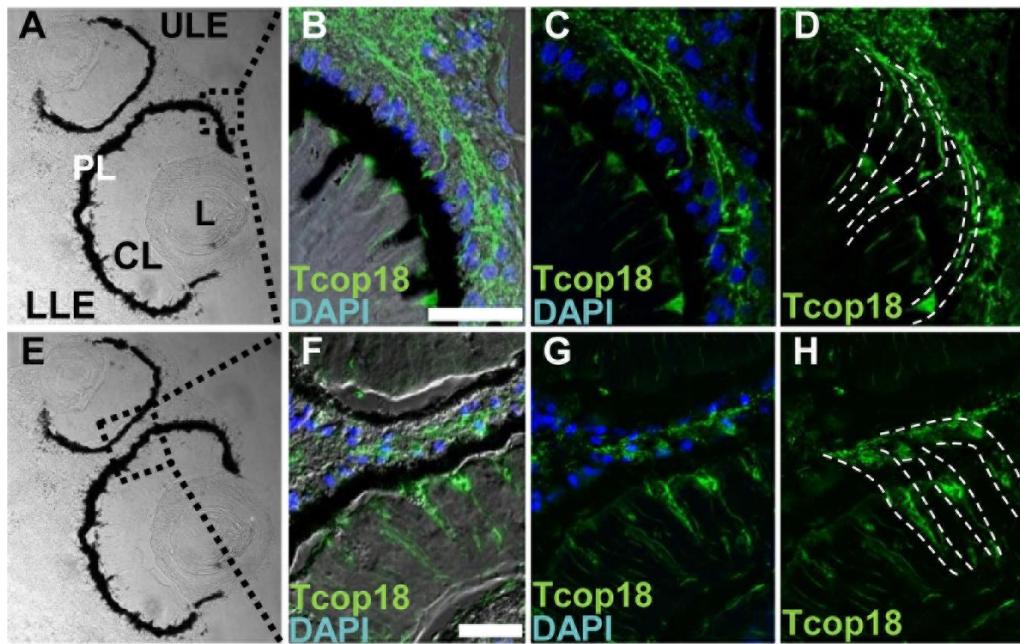

Opsin expression was normalized to expression of housekeeping gene Rpl32 and plotted as Z-score heat map (as described in Materials and methods). A – qRT-PCR results of Tcops expression in dissected *Tripedalia* body parts. Schematic representation of dissected body parts can be found in Fig. 4. Manum. – manumbrium, Gastric p. - gastric pouch, bell, Sub. Um. – sub-umbrella, Outer um. - outer umbrella. B – qRT-PCR results of Tcops expression during *Tripedalia* life cycle. Schematic representation of life stages can be found in Fig. 5. Np. Larva - non-pigmented larva, P. larva - pigmented larva, Veg. polyp - vegetative polyp, Metam. 1, Metam. 2-3, Metam. 4 - three polyp-to-medusa metamorphosing stages, Juv. med. - juvenile medusa, Ad. female - adult female and Ad. male - adult male.

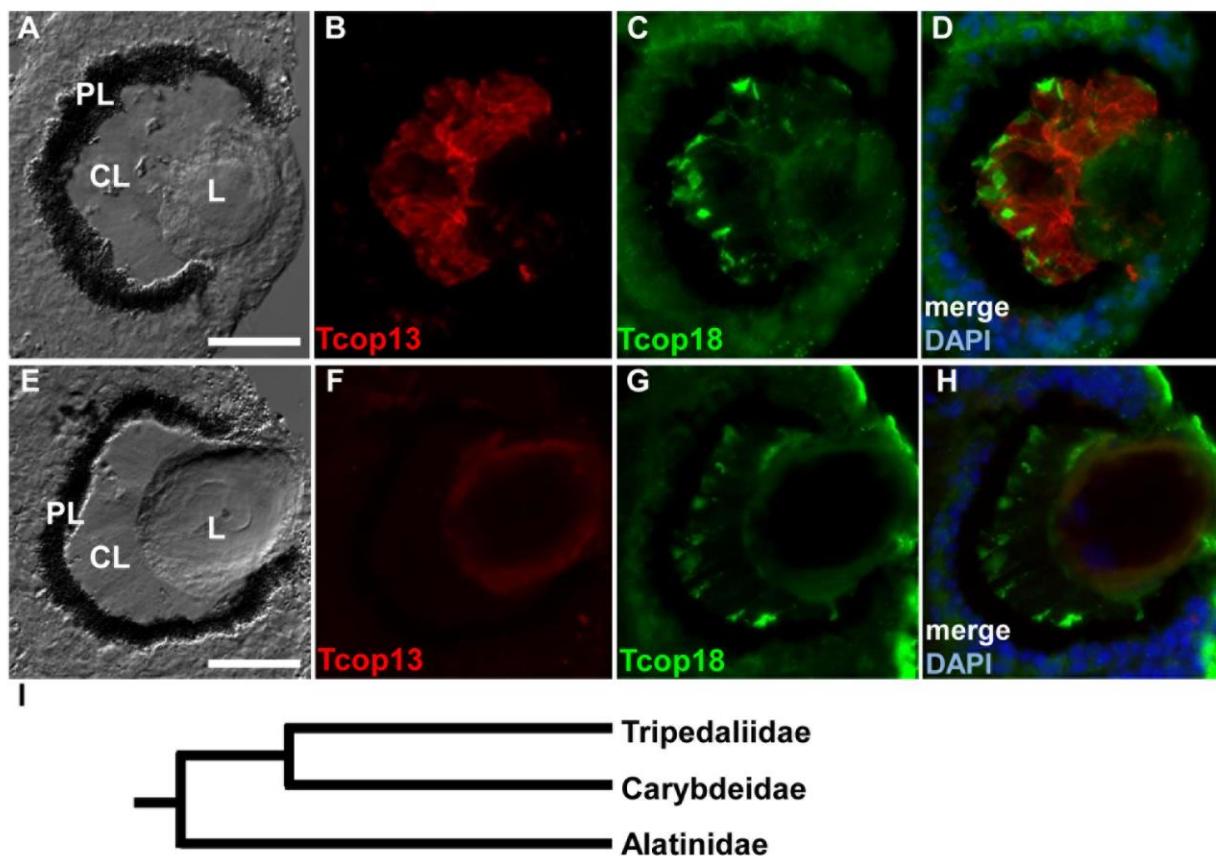

**Figure S7 – mRNA expression levels of opsins in rhopaliium and gonads**

Comparison of all *T. cystophora* opsin mRNA levels, measured by real-time PCR in rhopalia.

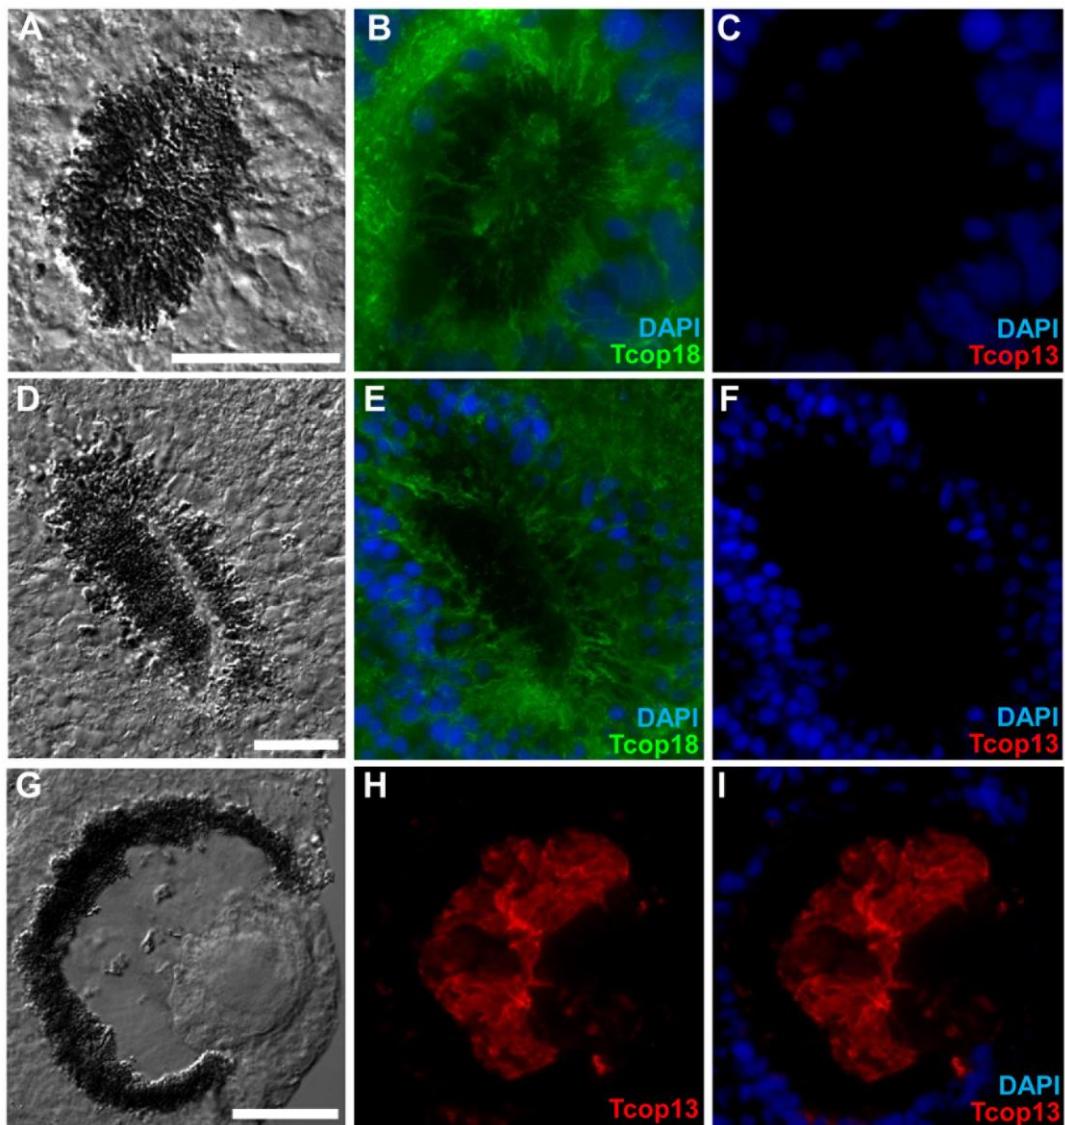

**Figure S8 – Details of type-A photoreceptor cells in lens eye retinas**

**A-H)** Confocal images of immunohistochemical staining for Tcop18 (green) in the examined parts of lens eye retinas. **D, H)** Shapes of type-A photoreceptor cells are indicated with a dotted white line.

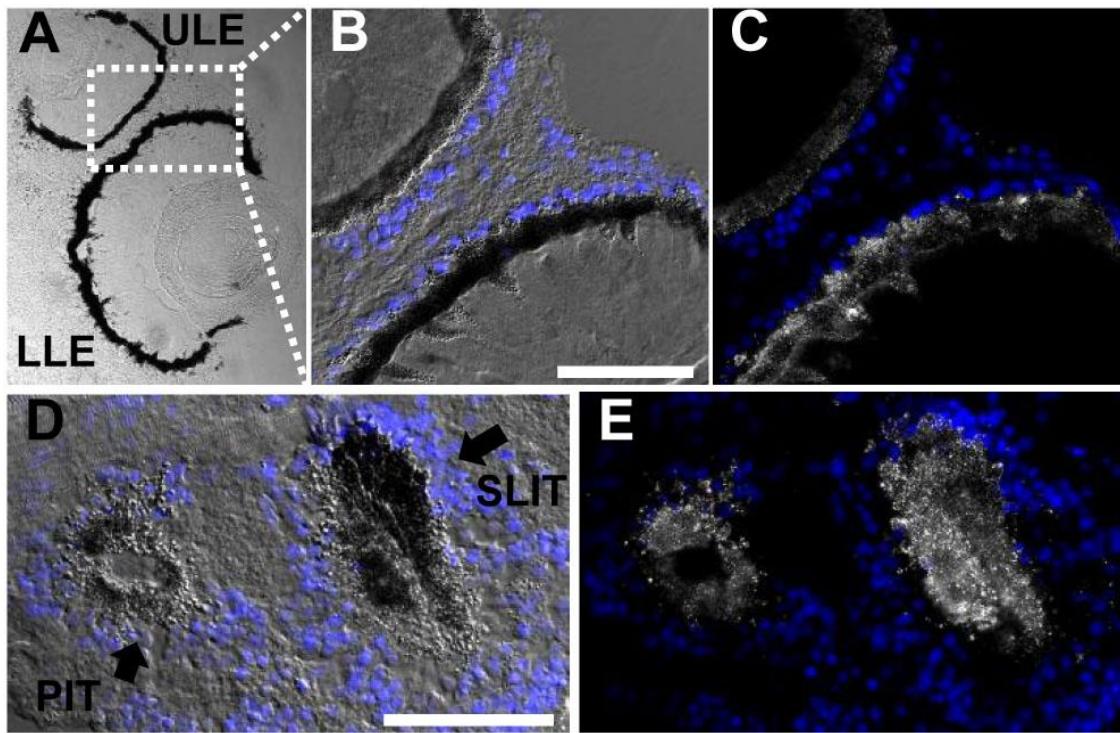

**Figure S9 – Comparison of Tcop13 and Tcop18 expression in the retinas of lens eye between Tripedaliidae and Alatinidae**

**A-D)** Confocal images of immunohistochemical staining for Tcop13 (red), Tcop18 (green) and DAPI (blue) in the developing LLE of juvenile *T. cystophora* medusa. **E-H)** Developing LLE of juvenile *Alatina marsupialis* medusa. **F)** Absence of Tcop13 signal in the retina. **I)** Phylogenetic relationship between Carybdeid families. (Scale bars: 20  $\mu$ m)

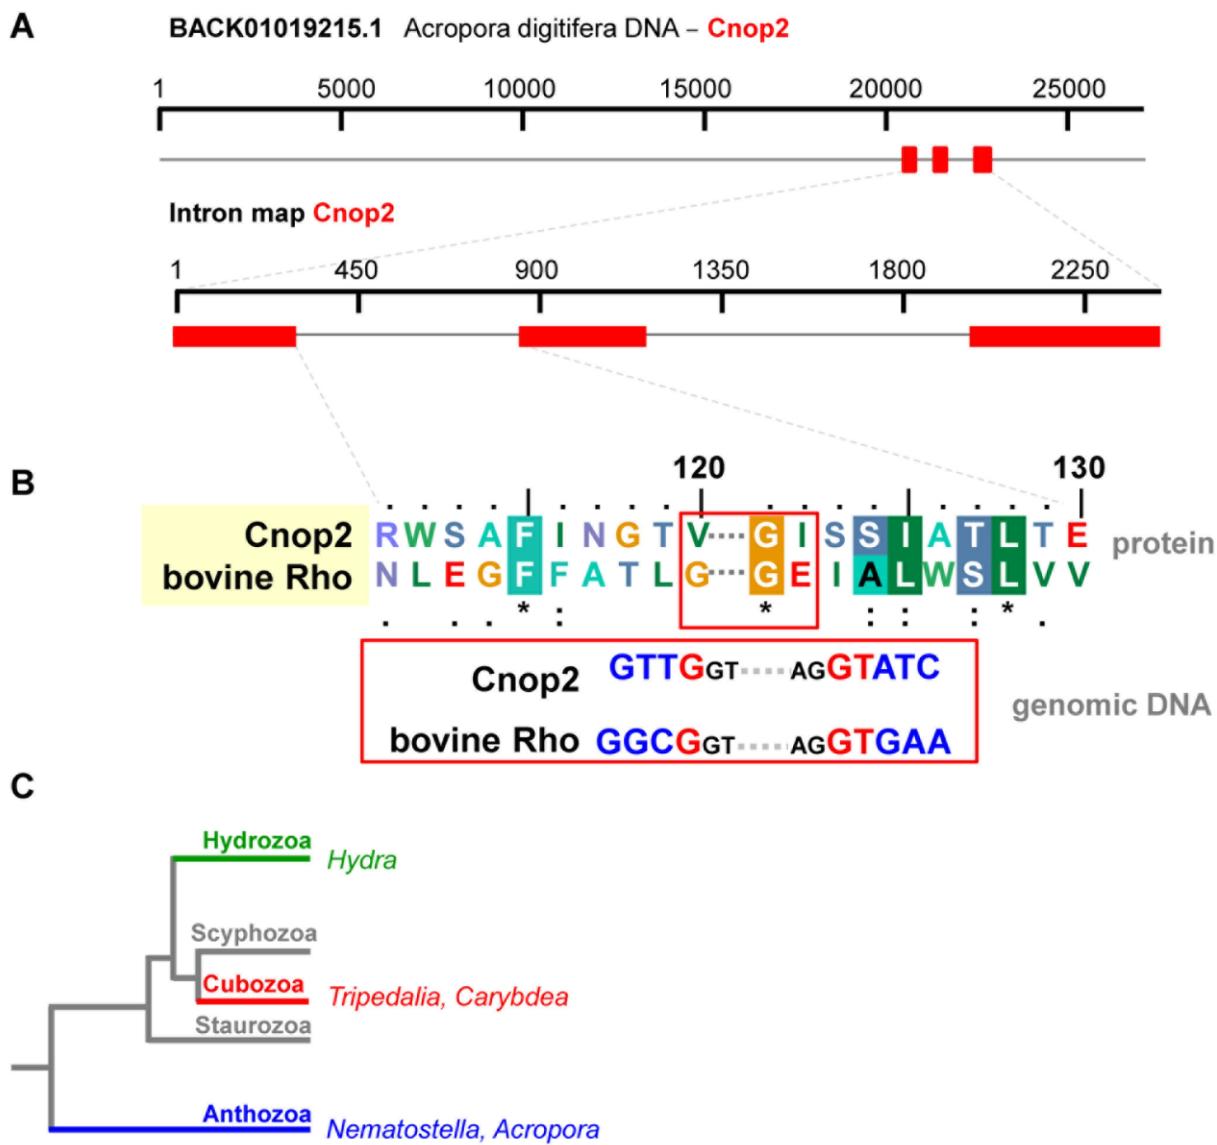

**Figure S10 – Expression pattern of Tcop18 in the pit and slit ocelli of *T. cystophora***

**A-D)** Confocal images of pit and slit eyes. **A)** Pit eye as seen in bright field. **B)** Immunohistochemical staining for Tcop18 (green) and DAPI (blue). **C)** Staining for Tcop13 (green) and DAPI (blue). Signal for Tcop13 was not present in the retina. **D)** Slit eye as seen in bright field. **E)** Immunohistochemical staining for Tcop18 (green) and DAPI (blue). **F)** Staining for Tcop13 (green) and DAPI (blue). Signal for Tcop13 was not present in the retina. Both ocelli types seem to be formed exclusively of type-A photoreceptors. (Scale bars: 20 µm) **G)** LLE as seen in brightfield. **H)-I)** Staining for Tcop13 (red) and DAPI (blue); used as positive control. (Scale bars: 20 µm)

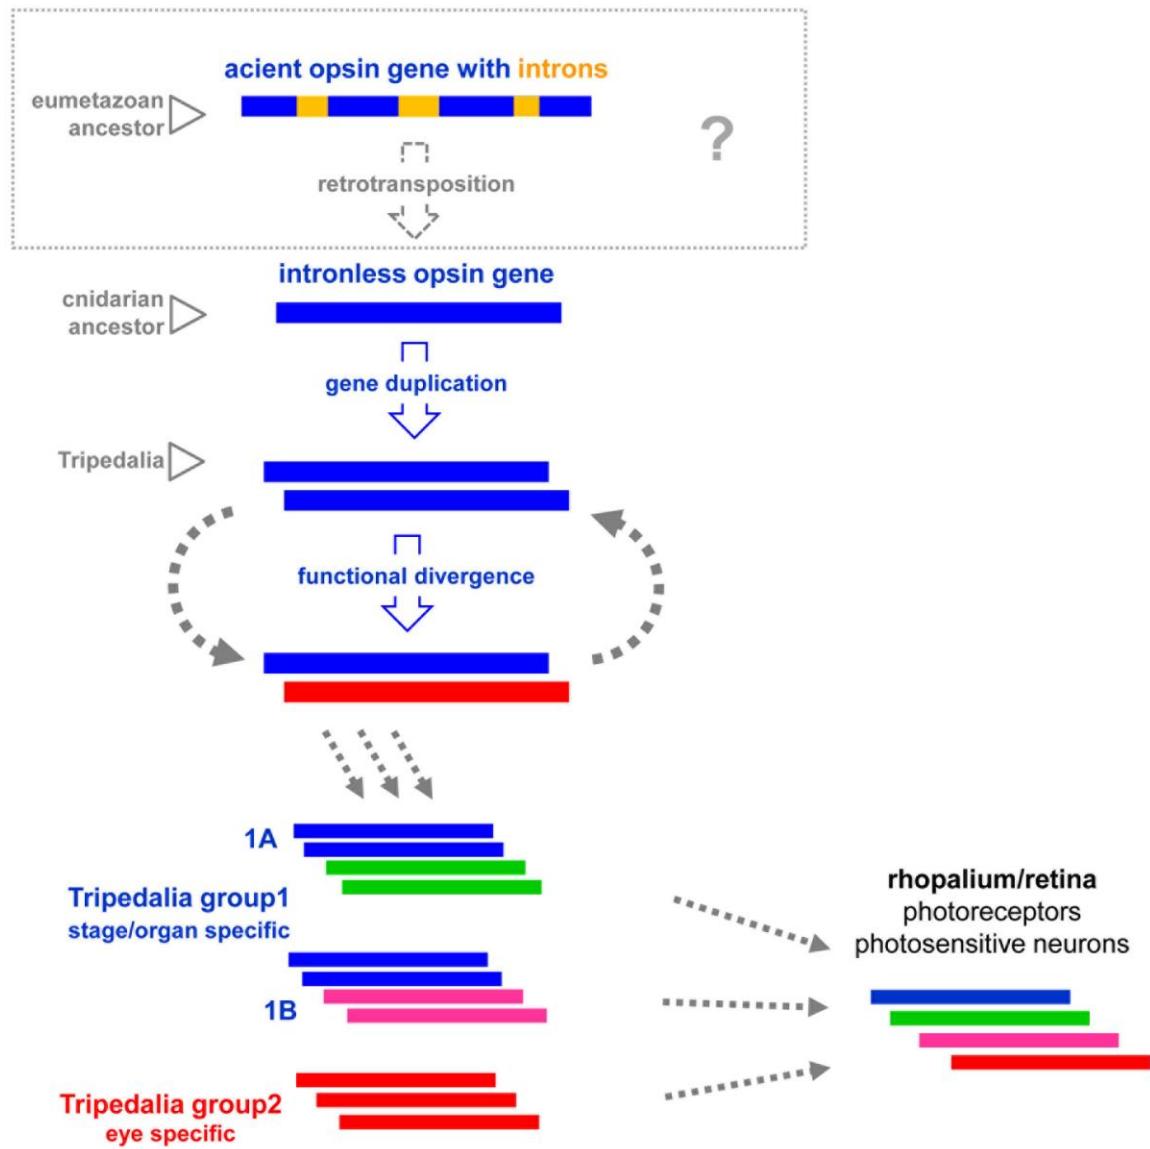

**Figure S11 – Types of shading pigment granules in the photoreceptors**

**A-C)** Detail of the pigmented areas of ULE and LLE retinas. **A-B)** In bright field, both types of pigment granules appear dark. **C)** The same detail in polarized light. Part of the granules alter the plane of polarization and appear white. **D-E)** Both types of pigment granules are present in the retinas of pit and slit eyes. **D)** Pit and slit eyes as seen in bright field. **E)** Pit and slit eyes as seen in polarized light. DAPI (blue). (Scale bars: 50  $\mu\text{m}$ )

**Figure S12 –Intron characterization of Cnop2 opsin from anthozoan *Acropora digitifera***

**A)** Cnop2 genomic localization and intron map. **B)** Partial protein alignment of bovine rhodopsin and Cnop2. Positions of the first intron in both genes are highlighted by red line. Introns from both species match in position and in phase (as shown on the genomic DNA). **C)** Phylogenetic relations within cnidaria.

**Figure S13 - Possible scenario for intron-less opsin emergence and subsequent expansion in *T. cystophora***

For further information see discussion.

**Additional file – *T. cystophora* phototaxis test movie**

Movie showing response of living *T.cystophora* medusa to light stimulus without and with presence of Gs cascade specific inhibitor. MPG movie can be viewed in any video software.
