

Supplemental figure S2

Supplemental figure S2 legend

A *pcf11* variant lacking the C-terminal zinc finger is not viable. A strain with a deletion of the chromosomal *PCF11* gene and a covering wild-type *PCF11* on an *URA3*-containing plasmid was transformed with a *LEU2*-containing plasmid with either wild-type *PCF11* or *pcf11* with amino acids 554-599 deleted. Transformants were plated on the indicated media using a spot assay with sequential cell dilution. The deletion mutant cannot grow on medium containing 5-FOA, which forces loss of the covering *URA3*-containing plasmid.
