Supplementary figures

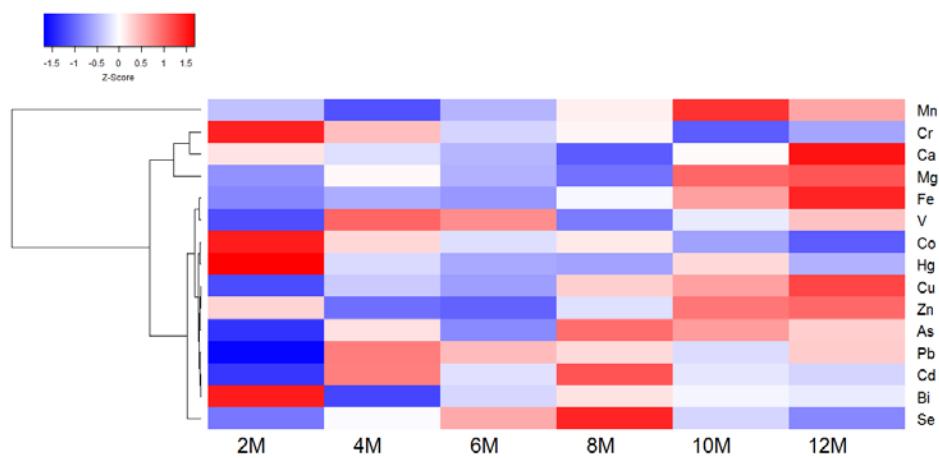

Supplementary Fig. S1. Clustering of the ionome. The color scale is from saturated blue (significantly negative correlation) to white (no significant correlation) and then to saturated red (significantly positive correlation). (A) WT mice; (B) 3 \times Tg-AD mice; (C) Se-treated mice.

Supplementary Fig. S2. The decision-tree analysis for group classification. The total number of samples is 66. The text at the top of a branch node indicates the rules. The numbers shown in a tree leaf node represent the correctly classified and covered samples by the corresponding decision rules. The bottom of the branch node shows the branch condition: left for “yes” and right for “no”. For example, if $\text{Fe} \geq 22$ covers 38 samples with 30 correctly classified and 8 misclassified samples. The accuracy rate for the rule $\text{Fe} \geq 22$ is 88% (58/66), and for the rule $\text{Se} < 49$ is 92% (61/66).

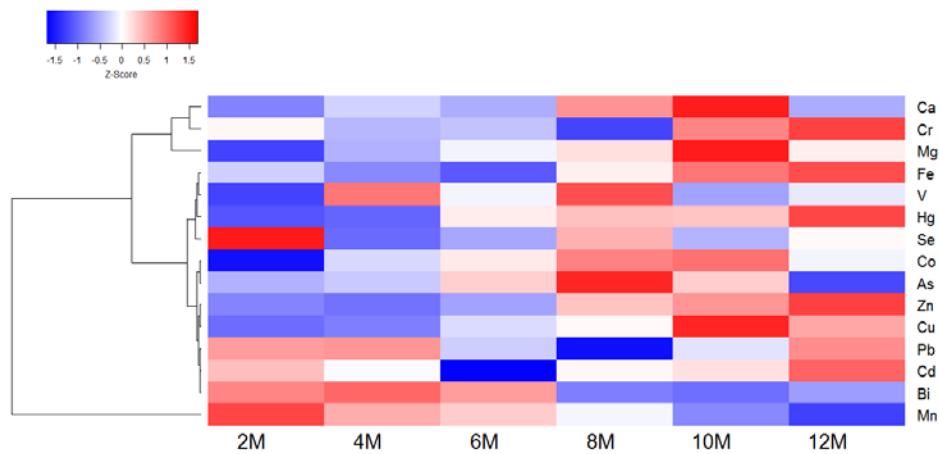

Supplementary Fig. S3. The elemental correlation network. Each node represents different elements. Differentially changed elements (DCEs) are highlighted in red (increased) and green (decreased). Green and red lines represent negative and positive correlation, respectively. Different color scales represent the magnitude of SCCs.
