

Figure S2: Night-time refeeding of flies after starvation mimics morning consumption. WT flies were subjected to the restricted feeding paradigm used for electrophysiology in Figure 6. Refeeding flies from ZT 12-18 after 18 hours of starvation (red symbols and upper X-axis) mimicked the amplitude of the morning feeding peak observed in WT flies fed *ad lib* (grey symbols and lower axis). N = 10 groups per condition.
