Cloning

Standard methods for cloning were used for the construction. PCR-amplified DNA fragments were sequenced after cloning into vectors. The vectors referred to in the *supplementary methods* and primers used for the cloning are listed in Supplementary Tables S6 and S7, respectively.

pGL4-OsNOMT₂₅₀, pGL4-OsNOMT₁₅₀, and pGL4-OsNOMT₅₀: The 5' 250-, 150-, or 50-bp upstream region of the *OsNOMT* promoter, extending from the transcriptional start site, was PCR-amplified and cloned into the pZErO2 vector (Invitrogen, CA, USA). Each promoter region was extracted and inserted into the multi-cloning sites of pGL4.10-Tnos (see the main text).

pGL4-OsNOMT₂₅₀₋₂₆: The region -250 to -26 bp from the transcriptional start site of *OsNOMT* was PCR-amplified and inserted into *EcoRV*-digested pGL4.10-Tnos.

Supplementary Figure S4 Recombinant proteins expressed using the wheat germ cell-free system.
 Two micrograms of the crude protein was applied in each lane. Red arrows indicate the desired proteins. **(a)** Detection of biotinylated-OsMYC2 by using anti-Biotin HRP. **(b)** Detection of FLAG-tagged proteins by using anti-FLAG M2 HRP. A chemiluminescent reagent visualized the recombinant proteins without LAS detection.
