Figure S9. QQ-plot for ASD association. The quantile-quantile plot is shown displaying observed vs. expected ASD association results for the TDT analysis of our trio dataset. Each point represents -log(P) for a SNP. The X-axis shows expected –log(P) and Y-axis shows observed –log(P), with the red line representing the null expection with a grey shaded 95% confidence interval. Different FDR thresholds are shown with dashed lines.
