Supplemental Table 1. The 339 microarray positives. Genes in bold are new positives that are not part of the set from Gaudet and Mango, 2002. Genes in green are expressed in the pharynx, while those in red are non-pharyngeal. Descriptions of predicted products are summarized from entries in WormBase, version 110. Expression data is as described by others, by our GFP reporters, or from our interpretations of data from the Kohara lab Nematode Expression Pattern Database (NEXTDB).
