

S3 Fig. TIPE3 expression is barely detectable in macrophages. Bone marrow derived macrophages from WT mice were untreated (M0), treated with IFN- γ (50 ng/ml) and LPS (10 ng/ml) (M1) or IL-4 (10 ng/ml) (M2) for 24 h. mRNA level of TIPE3 was examined by real-time RT-PCR. TIPE3 mRNA expression in intestine was used as the positive control. Result is representative of two independent experiments.
